Documentation Conventions

The following conventions apply throughout this manual:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>THIS TYPEFACE</strong> or <strong>this typeface</strong></td>
<td>Denotes syntax that you must enter exactly as shown.</td>
</tr>
<tr>
<td><strong>this typeface</strong></td>
<td>Represents a placeholder (or variable) in syntax for a value that you or the system must supply.</td>
</tr>
<tr>
<td><strong>underscore</strong></td>
<td>Indicates a default setting.</td>
</tr>
<tr>
<td><strong>this typeface</strong></td>
<td>Represents a placeholder (or variable), a cross-reference, or an important term. It may also indicate a button, menu item, or dialog box option you can click or select.</td>
</tr>
<tr>
<td><strong>this typeface</strong></td>
<td>Highlights a file name or command.</td>
</tr>
<tr>
<td>Key + Key</td>
<td>Indicates keys that you must press simultaneously.</td>
</tr>
<tr>
<td>{ }</td>
<td>Indicates two or three choices; type one of them, not the braces.</td>
</tr>
<tr>
<td>[ ]</td>
<td>Indicates a group of optional parameters. None are required, but you may select one of them. Type only the parameter in the brackets, not the brackets.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>...</td>
<td>Indicates that you can enter a parameter multiple times. Type only the parameter, not the ellipsis points (...).</td>
</tr>
<tr>
<td>. .</td>
<td>Indicates that there are (or could be) intervening or additional commands.</td>
</tr>

Related Publications

To view a current listing of our publications and to place an order, visit our World Wide Web sites, http://www.informationbuilders.com or http://www.iwaysoftware.com. You can also contact the Publications Order Department at (800) 969-4636.

Customer Support

Do you have questions about FOCUS?

Call Information Builders Customer Support Services (CSS) at (800) 736-6130 or (212) 736-6130. Customer Support Consultants are available Monday through Friday between 8:00 A.M. and 8:00 PM. EST to address all your FOCUS questions. Information Builders consultants can also give you general guidance regarding product capabilities and documentation. Please be ready to provide your six-digit site code (xxxx.xx) when you call.

You can also access support services electronically, 24 hours a day, with InfoResponse Online. InfoResponse Online is accessible through our World Wide Web site, http://www.informationbuilders.com. It connects you to the tracking system and known-problem database at the Information Builders support center. Registered users can open, update, and view the status of cases in the tracking system and read descriptions of reported software issues. New users can register immediately for this service. The technical support section of www.informationbuilders.com also provides usage techniques, diagnostic tips, and answers to frequently asked questions.

To learn about the full range of available support services, ask your Information Builders representative about InfoResponse Online, or call (800) 969-INFO.

Information You Should Have

To help our consultants answer your questions most effectively, please provide the following information when you call:

- Your six-digit site code (xxxx.xx).
- The stored procedure (preferably with line numbers) or FOCUS commands being used.
- The name of the Master File and Access File.
- The exact nature of the problem:
  - Are the results or the format incorrect? Are the text or calculations missing or misplaced?
  - The error message and return code, if applicable.
  - Is this related to any other problem?
Has the procedure or query ever worked in its present form? Has it been changed recently? How often does the problem occur?

What release of the operating system are you using? Has it, FOCUS, your security system, communications protocol, or front-end software changed?

Is this problem reproducible? If so, how?

Have you tried to reproduce your problem in the simplest form possible? For example, if you are having problems joining two data sources, have you tried executing a query containing the code to access a single data source?

Do you have a trace file?

How is the problem affecting your business? Is it halting development or production? Do you just have questions about functionality or documentation?

User Feedback

In an effort to produce effective documentation, the Documentation Services staff welcomes your opinions regarding this manual. Please use the Reader Comments form at the end of this manual to relay suggestions for improving the publication or to alert us to corrections. You can also use the Documentation Feedback form on our Web site, http://www.informationbuilders.com/bookstore/derf.html.

Thank you, in advance, for your comments.

Information Builders Consulting and Training

Interested in training? Information Builders Education Department offers a wide variety of training courses for this and other Information Builders products.

For information on course descriptions, locations, and dates, or to register for classes, visit our World Wide Web site (http://www.informationbuilders.com) or call (800) 969-INFO to speak to an Education Representative.
1 Performance Enhancements

This chapter describes features that enhance FOCUS performance.

Topics:
- CPU Performance Improvement
- Unlimited FOCSORT
- Direct HOLD FORMAT FOCUS
- Compiling MODIFY Expressions Using Native Arithmetic
**CPU Performance Improvement**

FOCUS Release 7.6 is the first release to use the IBM/C compiler to achieve performance improvements in CPU consumption for mainframe applications on z/OS and z/VM. CPU performance appears to benchmark from 5% to over 40% better in Release 7.6 than the prior release, 7.3, and appears to be roughly equivalent to statistics as far back as Release 7.0.8R released in 1999.

The benchmark tests were designed to approximate parts of a “typical” customer application to project real world expectations. From the test details, FOCUS customers can extrapolate the benchmark results to their own applications to approximate what CPU gains they may achieve.

Compared to Release 7.3.9, expect 5-10% improvement in CPU utilization for data extraction and reporting (TABLE), and 30-40% improvement for database modification procedures (MODIFY and MAINTAIN). Data intensive utilities such as REBUILD that typically absorb large amounts of CPU show about 40% improvement. Local environmental factors may affect the individual savings attained, and though different CPU models perform at varying speeds, the ratio of performance gains should be similar.

The wide range of performance improvements across the various FOCUS functional areas reflect the ratio of Assembler versus C code used by the FOCUS product for the selected function. For example, reporting (TABLE) employs a large percentage of fast-executing Assembler code during the expensive extraction phase, so the new C compiler has little effect on CPU utilization for reporting. Database updates (MODIFY and MAINTAIN), however, are almost entirely written in C so the savings are measurably larger.

For complete details of the benchmark tests and results, see the *Mainframe FOCUS Release 7.6 CPU Performance Improvement Benchmark* white paper on the Information Builders Web site at:

http://www.informationbuilders.com/products/whitepapers/pdf/Mainframe_FOCUS_Rel_7.6_WP.pdf

**Unlimited FOCSORT**

The FOCSORT file can grow to any size allowed by the operating system running and the available disk space. The user does not have to break a request up to accommodate massive files. In previous releases, the FOCSORT file was limited to 2 GB and the user received a FOC298 message when the Web FOCUS limit was exceeded. With no limit enforced by FOCUS, the operating system provides whatever warning and error handling it has for the management of a FOCSORT file that exceeds its limits.
**Direct HOLD FORMAT FOCUS**

**How to:**

Control Whether a HOLD File in FOCUS Format is Created Directly

By default, a HOLD file in FOCUS format is now created directly, without using an intermediate sequential file and an internally generated MODIFY procedure to load the file, as in previous releases.

The SET DIRECTHOLD command controls whether the HOLD file is created directly or whether the HOLD file is loaded using an internally generated MODIFY procedure and an intermediate sequential file called FOC$HOLD.

**Syntax:**  How to Control Whether a HOLD File in FOCUS Format is Created Directly

```plaintext
SET DIRECTHOLD = {ON|OFF}
```

Use the following syntax to issue the SET DIRECTHOLD command in a request.

```plaintext
ON TABLE SET DIRECTHOLD {ON|OFF}
```

where:

- **ON**
  
  Creates a FOCUS HOLD file directly without an intermediate sequential file and MODIFY procedure. ON is the default value.

- **OFF**
  
  Loads a FOCUS HOLD file using an internally generated MODIFY procedure and an intermediate sequential file called FOC$HOLD.

**Compiling MODIFY Expressions Using Native Arithmetic**

**How to:**

Control Compilation of MODIFY Expressions

**Reference:**

Usage Notes for SET MODCOMPUTE

The native compiler for MODIFY processes COMPUTE, IF, and VALIDATE expressions using the arithmetic operations built into the underlying operating system. This native compiler eliminates internal format conversions and speeds up expression processing. It significantly enhances the speed of expressions that use long packed fields and date fields.
Note that MODCOMPUTE replaces the functionality previously provided by SET COMPUTE for MODIFY. SET COMPUTE is now only respected in the TABLE environment.

**Note:** Expression compilers for MODIFY are supported only in Mainframe environments. Linux on the Mainframe does not support these compilers.

### Syntax: How to Control Compilation of MODIFY Expressions

```plaintext
SET MODCOMPUTE={NATV | NEW | OLD}
```

**where:**

**NATV**
- Activates the native compiler for MODIFY expressions. NATV is the default value.

**NEW**
- Compiles MODIFY expressions using the standard FOCUS compilation routines, which use high-precision floating point format for all arithmetic operations.

**OLD**
- Does not compile MODIFY expressions.

### Reference: Usage Notes for SET MODCOMPUTE

The following are usage notes for SET MODCOMPUTE:

- SET MODCOMPUTE can be issued in a user or system profile or on the command line.

- SET MODCOMPUTE is supported with compiled and uncompiled MODIFY procedures. Expression compilation is different from and compatible with MODIFY procedure compilation.

- Existing compiled MODIFY procedures run without recompilation. The MODCOMPUTE setting has no effect on previously compiled MODIFY procedures. In order to make use of this performance enhancement, compiled MODIFYs must be recompiled with SET MODCOMPUTE=NATV in effect.

- Expressions using the following features are not compiled by the native compiler:
  - LIKE operator.
  - DEFINE functions.
  - LAST function.
Reporting Enhancements

This chapter describes features that affect reporting applications. For additional information, see Chapter 8, *Raised Limits* and Chapter 3, *Output Format Enhancements*

**Topics:**
- Comparing Alphanumeric Fields to a Pattern With IF
- Assigning Column Numbers Only to Fields Displayed on Report Output
- Assigning Column Numbers to All Fields Used in a Request
- Controlling Underlining of ACROSS Objects
- Combinations of Summary Commands
- Producing Summary Columns for Horizontal Sort Fields
- Joining to a Fixed Format Sequential File Based on Multiple Fields
- Ranking Sort Field Values With the RNK. Prefix Operator
- Displaying a Row for Data Excluded by a Sort Phrase (PLUS OTHERS)
- SET EMPTYREPORT=ANSI
- Preserving Filter Definitions During Join Parsing
- SET SUMMARYLINES=EXPLICIT
- ON TABLE SET BYPANEL
- Left Outer Join Support
-FMLCAP Function
- FMLFOR Function
- FMLLIST Function
- Changing Titles of Columns Created Using Prefix Operators
- Joining Comma-Delimited Files
- Compiling DEFINEs With Missing Attributes
- SUBFOOT WITHIN
Comparing Alphanumeric Fields to a Pattern With IF

In this section:
Using Escape Characters for LIKE and UNLIKE

How to:
Screen Using LIKE and UNLIKE in an IF Phrase

Example:
Screening on Initial Characters
Screening on a Single Character

The IF phrase can specify the LIKE and UNLIKE operators to compare alphanumeric fields to a pattern. The pattern used for the comparison is called a mask.

The mask can use the following wildcard characters:

- The percent sign (%), which accepts any following sequence of zero or more characters as a match to the pattern.
- The underscore character (_), which accepts any single character in that position as a match to the pattern.

Syntax: How to Screen Using LIKE and UNLIKE in an IF Phrase

To search for records with the LIKE operator, use

```
IF field LIKE 'mask1' [OR 'mask2' ... ]
```

To reject records based on the mask value, use

```
IF field UNLIKE 'mask1' [OR 'mask2' ... ]
```

where:

- **field**
  - Is any valid field name or alias.
  - **mask1, mask2**

  Are the alphanumeric patterns you want to use for comparison. The single quotation marks are required if the mask contains blanks. There are two wildcard characters that you can use in a mask: the underscore (_) indicates that any single character in that position is acceptable; the percent sign (%) allows any following sequence of zero or more characters. Every other character in the mask accepts only itself in that position as a match to the pattern.
**Example: Screening on Initial Characters**

To list all employees who have taken basic-level courses, where every basic course begins with the word BASIC, issue the following request:

```
TABLE FILE EMPLOYEE
PRINT COURSE_NAME COURSE_CODE
BY LAST_NAME BY FIRST_NAME
IF COURSE_NAME LIKE 'BASIC%'
END
```

The output is:

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>FIRST_NAME</th>
<th>COURSE_NAME</th>
<th>COURSE_CODE</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLACKWOOD</td>
<td>ROSEMARIE</td>
<td>BASIC REPORT PREP NON-PROG</td>
<td>102</td>
</tr>
<tr>
<td>CROSS</td>
<td>BARBARA</td>
<td>BASIC REPORT PREP DP MGRS</td>
<td>107</td>
</tr>
<tr>
<td>JONES</td>
<td>DIANE</td>
<td>BASIC REPORT PREP FOR PROG</td>
<td>103</td>
</tr>
<tr>
<td>SMITH</td>
<td>MARY</td>
<td>BASIC REPORT PREP FOR PROG</td>
<td>103</td>
</tr>
<tr>
<td></td>
<td>RICHARD</td>
<td>BASIC RPT NON-DP MGRS</td>
<td>108</td>
</tr>
</tbody>
</table>

To list all employees who have taken higher level courses which do not begin with the word BASIC, issue the following request:

```
TABLE FILE EMPLOYEE
PRINT COURSE_NAME COURSE_CODE
BY LAST_NAME BY FIRST_NAME
IF COURSE_NAME UNLIKE 'BASIC%'
END
```

The output is:

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>FIRST_NAME</th>
<th>COURSE_NAME</th>
<th>COURSE_CODE</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLACKWOOD</td>
<td>ROSEMARIE</td>
<td>DECISION SUPPORT WORKSHOP</td>
<td>301</td>
</tr>
<tr>
<td></td>
<td></td>
<td>WHAT'S NEW IN FOCUS</td>
<td>202</td>
</tr>
<tr>
<td></td>
<td></td>
<td>TIMESHARING WORKSHOP</td>
<td>106</td>
</tr>
<tr>
<td></td>
<td></td>
<td>FILE DESC &amp; MAINT NON-PROG</td>
<td>104</td>
</tr>
<tr>
<td>CROSS</td>
<td>BARBARA</td>
<td>HOST LANGUAGE INTERFACE</td>
<td>302</td>
</tr>
<tr>
<td>JONES</td>
<td>DIANE</td>
<td>FOCUS INTERNALS</td>
<td>203</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ADVANCED TECHNIQUES</td>
<td>201</td>
</tr>
<tr>
<td></td>
<td></td>
<td>FILE DESCRIPT &amp; MAINT</td>
<td>101</td>
</tr>
<tr>
<td>MCKNIGHT</td>
<td>ROGER</td>
<td>FILE DESCRPT &amp; MAINT</td>
<td>101</td>
</tr>
<tr>
<td>SMITH</td>
<td>MARY</td>
<td>FILE DESCRPT &amp; MAINT</td>
<td>101</td>
</tr>
<tr>
<td>STEVENS</td>
<td>ALFRED</td>
<td>FILE DESCRPT &amp; MAINT</td>
<td>101</td>
</tr>
</tbody>
</table>
Example:  **Screening on a Single Character**

If you want to list all employees who have taken a 20x-series course, and you know that all of these courses have the same code except for the final character, issue the following request:

```
TABLE FILE EMPLOYEE

**Using Escape Characters for LIKE and UNLIKE**

How to:

Specify an Escape Character for a Mask in an IF Phrase

Example:

Screening With an Escape Character in an IF Phrase

Reference:

Usage Notes for Escape Characters in IF Phrases

There may be times when you want to use the percent sign or underscore as a normal character in the mask, not as a wildcard character. You can indicate when you want to treat the percent sign or underscore as a normal character by preceding them with an escape character in the mask. This technique enables you to search for the percent sign or underscore character in the data.
**Syntax:** How to Specify an Escape Character for a Mask in an IF Phrase

You can assign any single character as an escape character by prefacing it with the word ESCAPE in the LIKE or UNLIKE syntax

\[
\text{IF } \text{field} \ \{\text{LIKE} | \text{UNLIKE}\} \ 'mask1' \ \text{ESCAPE} \ 'a' \ [\text{OR} \ 'mask2' \ \text{ESCAPE} \ 'b' \ ... \\
\]

where:

- **field**
  - Is any valid field name or alias to be evaluated in the selection test.

- **mask1, mask2**
  - Are search patterns that you supply. The single quotation marks are required.

- **a, b ...**
  - Are single characters that you identify as escape characters. Each mask can specify its own escape character or use the same character as other masks. If you embed the escape character in the mask, before a % or _, the % or _ character is treated as a literal, rather than as a wildcard. The single quotation marks are required if the mask contains blanks.

**Reference: Usage Notes for Escape Characters in IF Phrases**

- The escape character itself can be escaped, thus becoming a normal character in a string (for example, 'abc\%\\').

- The use of an escape character in front of any character other than %, _, and itself is ignored.

- Multiple escape characters can be used per LIKE phrase in an IF test.

- The escape character is only in effect when the ESCAPE syntax is included in the LIKE phrase.
Example: Screening With an Escape Character in an IF Phrase

The VIDEOTR2 data source contains an e-mail address field. To search for e-mail addresses with the characters 'handy_' you can issue the following request:

```
TABLE FILE VIDEOTR2
PRINT CUSTID LASTNAME FIRSTNAME EMAIL
IF EMAIL LIKE 'handy_%'
END
```

Because the underscore character functions as a wildcard character, this request returns two instances, only one of which contains the underscore character.

The output is:

```
CUSTID  LASTNAME         FIRSTNAME   EMAIL
------  --------         ---------   ----- 
0944    HANDLER          EVAN        handy_man@usa.com
0944    HANDLER          EVAN        handyman@usa.com 
```

To retrieve only the instance that contains the underscore character, you must indicate that the underscore should be treated as a normal character, not a wildcard. The following request retrieves only the instance with the underscore character in the e-mail field:

```
TABLE FILE VIDEOTR2
PRINT CUSTID LASTNAME FIRSTNAME EMAIL
IF EMAIL LIKE 'handy\_%' ESCAPE '\'
END
```

The output is:

```
CUSTID  LASTNAME         FIRSTNAME   EMAIL
------  --------         ---------   ----- 
0944    HANDLER          EVAN        handy_man@usa.com 
```
Assigning Column Numbers Only to Fields Displayed on Report Output

**In this section:**
Using Column Notation in a Report Request

**How to:**
Control the Creation of Column References

**Reference:**
Usage Notes for SET CNOTATION

**Example:**
Using Column Notation in a Non-FML Request With CNOTATION=ALL
Using Column Notation in a Non-FML Request With CNOTATION=PRINTONLY
Using CNOTATION=PRINTONLY With Column Numbers in an FML Request
Using CNOTATION=PRINTONLY to RECAP Over Contiguous Columns in an FML Request
Using CNOTATION=PRINTONLY With Relative Column Addressing in an FML Request
Using CNOTATION=PRINTONLY With Cell Notation in an FML Request
Using NOPRINT, Field Reformatting, and COMPUTE With Column Notation

Column notation assigns a sequential column number to each column in the internal matrix created for a report request. You can use column notation in COMPUTE and RECAP commands to refer to these columns in your request.

Because column numbers refer to columns in the internal matrix, they are assigned after retrieval and aggregation are completed. Columns not actually displayed on the report output may exist in the internal matrix. For example, calculated values used in the request generate one or more columns in the internal matrix. Fields with the NOPRINT option take up a column in the internal matrix, and a reformatted field generates an additional column for the reformatted value. Certain RECAP calculations such as FORECAST or REGRESS generate multiple columns in the internal matrix.

BY fields are not assigned column numbers but, by default, every other column in the internal matrix is assigned a column number, which means that you have to account for all of the internally generated columns if you want to refer to the appropriate column value in your request. You can change this default column assignment behavior with the SET CNOTATION=PRINTONLY command, which assigns column numbers only to columns that display on the report output.
Syntax: **How to Control the Creation of Column References**

```sql
SET CNOTATION={ALL | PRINTONLY | EXPLICIT}
```

where:

**ALL**
Assigns column reference numbers to every column in the internal matrix. ALL is the default value.

**PRINTONLY**
Assigns column reference numbers only to columns that display on the report output.

**EXPLICIT**
Assigns column reference numbers to all columns used in a request, whether displayed or not. Details are described in the feature named Assigning Column Numbers to All Fields Used in a Request.

**Note:** This setting is not supported in an ON TABLE phrase.

**Using Column Notation in a Report Request**

To create a column reference in a request, you can:

- Preface the column number with a C in a non-FML request.
- Use the column number as an index in conjunction with a row label in an FML request. With this type of notation, you can specify a specific column, a relative column number, or a sequence or series of columns. See the *Creating Reports* manual for a complete description of this notation.
- Refer to a particular cell in an FML request using the notation `E(r,c)`, where `r` is a row number and `c` is a column number. See the *Creating Reports* manual for a complete description of this notation.
Example: Using Column Notation in a Non-FML Request With CNOTATION=ALL

In the following request with CNOTATION=ALL, the product of C1 and C2 does not calculate TRANSTOT times QUANTITY because the reformatting generates additional columns.

```
SET CNOTATION = ALL

TABLE FILE VIDEOTRK
SUM TRANSTOT/D12.2 QUANTITY/D12.2
AND COMPUTE
PRODUCT = C1 * C2;
BY TRANSDATE
END
```

The output is:

<table>
<thead>
<tr>
<th>TRANSDATE</th>
<th>TRANSTOT</th>
<th>QUANTITY</th>
<th>PRODUCT</th>
</tr>
</thead>
<tbody>
<tr>
<td>91/06/17</td>
<td>57.03</td>
<td>12.00</td>
<td>3,252.42</td>
</tr>
<tr>
<td>91/06/18</td>
<td>21.25</td>
<td>2.00</td>
<td>451.56</td>
</tr>
<tr>
<td>91/06/19</td>
<td>38.17</td>
<td>5.00</td>
<td>1,456.95</td>
</tr>
<tr>
<td>91/06/20</td>
<td>14.23</td>
<td>3.00</td>
<td>202.49</td>
</tr>
<tr>
<td>91/06/21</td>
<td>44.72</td>
<td>7.00</td>
<td>1,999.88</td>
</tr>
<tr>
<td>91/06/24</td>
<td>126.28</td>
<td>12.00</td>
<td>15,946.63</td>
</tr>
<tr>
<td>91/06/25</td>
<td>47.74</td>
<td>8.00</td>
<td>2,279.11</td>
</tr>
<tr>
<td>91/06/26</td>
<td>40.97</td>
<td>2.00</td>
<td>1,678.54</td>
</tr>
<tr>
<td>91/06/27</td>
<td>60.24</td>
<td>9.00</td>
<td>3,628.85</td>
</tr>
<tr>
<td>91/06/28</td>
<td>31.00</td>
<td>3.00</td>
<td>961.00</td>
</tr>
</tbody>
</table>

BY fields do not get a column reference, so the first column reference is for TRANSTOT with its original format, then the reformatted version. Next is QUANTITY with its original format and then the reformatted version. Last is the calculated value, PRODUCT, which represents TRANSTOT (F7.2) multiplied by TRANSTOT (D12.2).
Example: Using Column Notation in a Non-FML Request With CNOTATION=PRINTONLY

Setting CNOTATION=PRINTONLY assigns column references to the output columns only. In this case the product of C1 and C2 does calculate TRANSTOT times QUANTITY.

```
SET CNOTATION = PRINTONLY

TABLE FILE VIDEOTRK
SUM TRANSTOT/D12.2 QUANTITY/D12.2
AND COMPUTE
PRODUCT = C1 * C2;
BY TRANSDATE
END
```

The output is:

<table>
<thead>
<tr>
<th>TRANSDATE</th>
<th>TRANSTOT</th>
<th>QUANTITY</th>
<th>PRODUCT</th>
</tr>
</thead>
<tbody>
<tr>
<td>91/06/17</td>
<td>57.03</td>
<td>12.00</td>
<td>684.36</td>
</tr>
<tr>
<td>91/06/18</td>
<td>21.25</td>
<td>2.00</td>
<td>42.50</td>
</tr>
<tr>
<td>91/06/19</td>
<td>38.17</td>
<td>5.00</td>
<td>190.85</td>
</tr>
<tr>
<td>91/06/20</td>
<td>14.23</td>
<td>3.00</td>
<td>42.69</td>
</tr>
<tr>
<td>91/06/21</td>
<td>44.72</td>
<td>7.00</td>
<td>313.04</td>
</tr>
<tr>
<td>91/06/24</td>
<td>126.28</td>
<td>12.00</td>
<td>1,515.36</td>
</tr>
<tr>
<td>91/06/25</td>
<td>47.74</td>
<td>8.00</td>
<td>381.92</td>
</tr>
<tr>
<td>91/06/26</td>
<td>40.97</td>
<td>2.00</td>
<td>81.94</td>
</tr>
<tr>
<td>91/06/27</td>
<td>60.24</td>
<td>9.00</td>
<td>542.16</td>
</tr>
<tr>
<td>91/06/28</td>
<td>31.00</td>
<td>3.00</td>
<td>93.00</td>
</tr>
</tbody>
</table>
### Example: Using CNOTATION=PRINTONLY With Column Numbers in an FML Request

In the following request, the reformatting of fields generates additional columns in the internal matrix. In the second RECAP expression, note that because of the CNOTATION setting:

- TOTCASH(1) refers to total cash in displayed column 1.
- TOTCASH(2) refers to total cash in displayed column 2.
- The resulting calculation is displayed in column 2 of the row labeled CASH GROWTH(%).
- The RECAP value is only calculated for the column specified.

```ml
SET CNOTATION=PRINTONLY
DEFINE FILE LEDGER
CUR_YR/I5C=AMOUNT;
LAST_YR/I5C=.87*CUR_YR - 142;
END
TABLE FILE LEDGER
SUM CUR_YR/F9.2 AS 'CURRENT,YEAR'
LAST_YR/F9.2 AS 'LAST,YEAR'
FOR ACCOUNT
1010 AS 'CASH ON HAND'                             OVER
1020 AS 'DEMAND DEPOSITS'                          OVER
1030 AS 'TIME DEPOSITS'                            OVER
BAR                                                OVER
RECAP TOTCASH/F9.2C= R1 + R2 + R3; AS 'TOTAL CASH' OVER
" "                                                OVER
RECAP GROCASH(2)/F9.2C=100*TOTCASH(1)/TOTCASH(2) - 100;
AS 'CASH GROWTH(%)'
END
```

The output is:

<table>
<thead>
<tr>
<th></th>
<th>CURRENT YEAR</th>
<th>LAST YEAR</th>
</tr>
</thead>
<tbody>
<tr>
<td>CASH ON HAND</td>
<td>8784.00</td>
<td>7214.00</td>
</tr>
<tr>
<td>DEMAND DEPOSITS</td>
<td>4494.00</td>
<td>3482.00</td>
</tr>
<tr>
<td>TIME DEPOSITS</td>
<td>7961.00</td>
<td>6499.00</td>
</tr>
<tr>
<td>TOTAL CASH</td>
<td>21,239.00</td>
<td>17,195.00</td>
</tr>
<tr>
<td>CASH GROWTH(%)</td>
<td></td>
<td>23.52</td>
</tr>
</tbody>
</table>
Example: **Using CNOTATION=PRINTONLY to RECAP Over Contiguous Columns in an FML Request**

In this example, the RECAP calculation for ATOT occurs only for displayed columns 2 and 3, as specified in the request. No calculation is performed for displayed column 1.

```FML
SET CNOTATION=PRINTONLY
DEFINE FILE LEDGER
CUR_YR/I5C=AMOUNT;
LAST_YR/I5C=.87*CUR_YR - 142;
NEXT_YR/I5C=1.13*CUR_YR + 222;
END
TABLE FILE LEDGER
SUM NEXT_YR/F9.2 CUR_YR/F9.2 LAST_YR/F9.2
FOR ACCOUNT
10$$ AS 'CASH' OVER
1100 AS 'ACCOUNTS RECEIVABLE' OVER
1200 AS 'INVENTORY' OVER
BAR OVER
RECAP ATOT(2,3)/I5C = R1 + R2 + R3;
AS 'ASSETS ACTUAL'
END
```

The output is:

<table>
<thead>
<tr>
<th></th>
<th>NEXT_YR</th>
<th>CUR_YR</th>
<th>LAST_YR</th>
</tr>
</thead>
<tbody>
<tr>
<td>CASH</td>
<td>25991.00</td>
<td>21239.00</td>
<td>17195.00</td>
</tr>
<tr>
<td>ACCOUNTS RECEIVABLE</td>
<td>21941.00</td>
<td>18829.00</td>
<td>15954.00</td>
</tr>
<tr>
<td>INVENTORY</td>
<td>31522.00</td>
<td>27307.00</td>
<td>23329.00</td>
</tr>
<tr>
<td>ASSETS ACTUAL</td>
<td>---------</td>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td></td>
<td>67,375</td>
<td>56,478</td>
<td></td>
</tr>
</tbody>
</table>
Example: **Using CNOTATION=PRINTONLY With Relative Column Addressing in an FML Request**

This example computes the change in cash (CHGCASH) for displayed columns 1 and 2.

SET CNOTATION=PRINTONLY
DEFINE FILE LEDGER
CUR_YR/I5C=AMOUNT;
LAST_YR/I5C=.87*CUR_YR - 142;
NEXT_YR/I5C=1.13*CUR_YR + 222;
END
TABLE FILE LEDGER
SUM NEXT_YR/F9.2 CUR_YR/F9.2 LAST_YR/F9.2
FOR ACCOUNT
10$$ AS 'TOTAL CASH' LABEL TOTCASH OVER " " OVER
RECAP CHGCASH(1,2)/I5SC = TOTCASH(*) - TOTCASH(*+1); AS 'CHANGE IN CASH'
END

The output is:

<table>
<thead>
<tr>
<th></th>
<th>NEXT_YR</th>
<th>CUR_YR</th>
<th>LAST_YR</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOTAL CASH</td>
<td>25991.00</td>
<td>21239.00</td>
<td>17195.00</td>
</tr>
<tr>
<td>CHANGE IN CASH</td>
<td>4,752</td>
<td>4,044</td>
<td></td>
</tr>
</tbody>
</table>

Example: **Using CNOTATION=PRINTONLY With Cell Notation in an FML Request**

In this request, two RECAP expressions derive VARIANCEs (EVAR and WVAR) by subtracting values in four displayed columns (1, 2, 3, 4) in row three (PROFIT); these values are identified using cell notation (r,c).

SET CNOTATION=PRINTONLY
TABLE FILE REGION
SUM E_ACTUAL/F9.2 E_BUDGET/F9.2 W_ACTUAL/F9.2 W_BUDGET/F9.2
FOR ACCOUNT
3000 AS 'SALES' OVER
3100 AS 'COST' OVER
BAR OVER
RECAP PROFIT/I5C = R1 - R2; OVER " " OVER
RECAP EVAR(1)/I5C = E(3,1) - E(3,2); AS 'EAST VARIANCE' OVER
RECAP WVAR(3)/I5C = E(3,3) - E(3,4); AS 'WEST VARIANCE'
END
Assigning Column Numbers Only to Fields Displayed on Report Output

The output is:

<table>
<thead>
<tr>
<th></th>
<th>E_ACTUAL</th>
<th>E_BUDGET</th>
<th>W_ACTUAL</th>
<th>W_BUDGET</th>
</tr>
</thead>
<tbody>
<tr>
<td>SALES</td>
<td>6000.00</td>
<td>4934.00</td>
<td>7222.00</td>
<td>7056.00</td>
</tr>
<tr>
<td>COST</td>
<td>4650.00</td>
<td>3760.00</td>
<td>5697.00</td>
<td>5410.00</td>
</tr>
<tr>
<td>PROFIT</td>
<td>1,350</td>
<td>1,174</td>
<td>1,525</td>
<td>1,646</td>
</tr>
</tbody>
</table>

EAST VARIANCE 176
WEST VARIANCE -121

Example: Using NOPRINT, Field Reformatting, and COMPUTE With Column Notation

The following request has a field that is not printed, several reformatted fields and three calculated values. With SET CNOTATION=PRINTONLY, the column references result in correct output.

```
SET CNOTATION = PRINTONLY
DEFINE FILE LEDGER
  CUR_YR/I5C=AMOUNT;
  LAST_YR/I5C=.87*CUR_YR - 142;
  NEXT_YR/I5C=1.13*CUR_YR + 222;
END
TABLE FILE LEDGER
  SUM NEXT_YR NOPRINT CUR_YR
  COMPUTE AMT2/D6 = AMOUNT *2;
  LAST_YR/D5 AMOUNT NEXT_YR
  COMPUTE AMT3/D6 = AMOUNT*3;
  COMPUTE AMT4/D6 = AMOUNT*4;
FOR ACCOUNT
  10$5 AS 'CASH'          OVER
  1100 AS 'ACCTS. REC.'   OVER
  1200 AS 'INVENTORY'     OVER
  BAR                     OVER
  Recap ATOT/I8C = R1 + R2 + R3; AS 'TOTAL' OVER
  Recap Diff(2,10,2)/D8 = ATOT(*) - ATOT(*-1);
END
```

The output is:

<table>
<thead>
<tr>
<th></th>
<th>CUR_YR</th>
<th>AMT2</th>
<th>LAST_YR</th>
<th>AMOUNT</th>
<th>NEXT_YR</th>
<th>AMT3</th>
<th>AMT4</th>
</tr>
</thead>

</tbody>
</table>
Reference: Usage Notes for SET CNOTATION

- BY fields are not assigned column reference numbers.
- ACROSS fields do have column reference numbers and they will always show.
- Columns created internally can be seen in non-FML requests by creating a HOLD file from the request and examining the HOLD Master File that is created.

Assigning Column Numbers to All Fields Used in a Request

How to:
Control the Creation of Column Reference Numbers

Example:
Using Column Notation With NOPRINT in a non-FML Request
Using Cell Notation in an FML Request

Reference:
Usage Notes for Column Numbers

Column notation enables you to refer to columns in the internal matrix by number instead of field name when performing calculations on those values.

Certain reporting options create additional columns in the internal matrix that do not display on the report output. For example, when the request reformats a field, the original field and the reformatted field both become columns in the internal matrix. In this case, both versions of the field are assigned column numbers. Other reporting options can create several generated fields in the internal matrix to hold intermediate calculations. By default, you must take all of these additional columns into account when using column notation in a request.

The CNOTATION = EXPLICIT parameter assigns column numbers only to fields that are explicitly referenced in the request, eliminating the need to think about column notation references for generated fields in the matrix. This parameter also applies to FML requests that use column numbers, contiguous column notation in RECAP expressions, column addressing, relative column addresses, and cell notation.
CNOTATION has three possible values:

- **ALL** to create column notation for all fields. This is the default value.
- **PRINTONLY** to create column notation for fields displayed on the report output.
- **EXPLICIT** to create column notation for fields explicitly stated in the request whether displayed or not.

**Syntax:** How to Control the Creation of Column Reference Numbers

\[
\text{SET CNOTATION=\{ALL|PRINTONLY|EXPLICIT\}}
\]

where:

- **ALL**
  - Assigns column reference numbers to every column in the internal matrix. ALL is the default value.

- **PRINTONLY**
  - Assigns column reference numbers only to columns that display in the report output.

- **EXPLICIT**
  - Assigns column reference numbers to all fields referenced in the request, whether displayed or not.

**Reference: Usage Notes for Column Numbers**

- **BY** fields are not assigned column numbers.
- **ACROSS** columns are assigned column numbers.
- Calculated fields are assigned column numbers.
- Column numbers outside the range of the columns created in the request are allowed under the following circumstances (and are treated as containing the value zero):
  - When specified in a COMPUTE command issued after an ACROSS phrase.
  - In a cell reference in an FML RECAP command.

In those cases, it is not possible to know in advance how many columns will be generated by the syntax. Using a column number outside of the range in any other context generates the following message:

\[(FOC258)\text{ FIELDNAME OR COMPUTATIONAL ELEMENT NOT RECOGNIZED: column}\]
Example: Using Column Notation With NOPRINT in a non-FML Request

The following request, sums TRANSTOT, QUANTITY, and TRANSCODE by TRANSDATE. TRANSTOT has the NOPRINT option, so it is not displayed on the report output. The request also calculates the following fields using COMPUTE commands:

- TTOT2, which has the same value as TRANSTOT and displays on the report output.
- UNIT_COST1, which is calculated by dividing column1 by column2.
- UNIT_COST2, which is calculated by dividing column1 by QUANTITY.

```plaintext
SET CNOTATION = ALL
TABLE FILE VIDEOTRK
SUM TRANSTOT/D7.2 NOPRINT QUANTITY/D7.2 TRANSCODE
  COMPUTE TTOT2/D7.2 = C1;
  COMPUTE UNIT_COST1/D7.2 = C1/C2;
  COMPUTE UNIT_COST2/D7.2 = C1/QUANTITY;
BY TRANSDATE
END
```

In this request, only the setting CNOTATION=EXPLICIT gives the correct result. The following discussion clarifies the reason the EXPLICIT setting is required.

With CNOTATION=ALL, all fields in the internal matrix are assigned column numbers. In particular, the request creates the following column references:

- C1 is TRANSTOT with its original format.
- C2 is TRANSTOT with format D7.2.
- C3 is QUANTITY with its original format.
- C4 is QUANTITY with format D7.2.
- C5 is TRANSCODE.
UNIT_COST1 is C1/C2. These column numbers have both been assigned to TRANSTOT, so UNIT_COST1 always equals 1. UNIT_COST2 is C1 (TRANSTOT) divided by QUANTITY. The output is:

<table>
<thead>
<tr>
<th>TRANSDATE</th>
<th>QUANTITY</th>
<th>TRANSCODE</th>
<th>TTOT2</th>
<th>UNIT_COST1</th>
<th>UNIT_COST2</th>
</tr>
</thead>

<td>1.00</td>
<td>10.33</td>
</tr>
</tbody>
</table>

With CNOTATION = PRINTONLY, the field TRANSTOT, which has the NOPRINT option, is not assigned any column numbers. QUANTITY with its original format is not assigned a column number because it is not displayed on the report output. The reformatted QUANTITY field is displayed and is assigned a column number. Therefore, the request creates the following column references:

- C1 is QUANTITY with format D7.2.
- C2 is TRANSCODE.

UNIT_COST1 is C1/C2, QUANTITY/TRANSCODE. UNIT_COST2 is C1 (QUANTITY) divided by QUANTITY. Therefore, UNIT_COST2 always equals 1. The output is:

<table>
<thead>
<tr>
<th>TRANSDATE</th>
<th>QUANTITY</th>
<th>TRANSCODE</th>
<th>TTOT2</th>
<th>UNIT_COST1</th>
<th>UNIT_COST2</th>
</tr>
</thead>
<tbody>
<tr>
<td>91/06/17</td>
<td>12.00</td>
<td>10</td>
<td>12.00</td>
<td>1.20</td>
<td>1.00</td>
</tr>
<tr>
<td>91/06/18</td>

<td>3.00</td>
<td>3</td>
<td>3.00</td>
<td>1.00</td>
<td>1.00</td>
</tr>
</tbody>
</table>
With CNOTATION = EXPLICIT, the results are correct. The reformatted TRANSTOT field is explicitly referenced in the request, so it is assigned a column number even though it is not displayed. However, the TRANSTOT field with its original format is not assigned a column number. The QUANTITY field with its original format is not assigned a column number because it is not explicitly referenced in the request. The reformatted QUANTITY field is assigned a column number. Therefore, the request creates the following column references:

- C1 is TRANSTOT with format D7.2.
- C2 is QUANTITY with format D7.2.
- C3 is TRANSCODE.

UNIT_COST1 is C1/C2, TRANSTOT/QUANTITY. UNIT_COST2 is C1 (TRANSTOT) divided by QUANTITY. Therefore, UNIT_COST2 always equals UNIT_COST1. The output is:

**Example: Using Cell Notation in an FML Request**

In the following request, CUR_YR has the NOPRINT option. The CHGCASH RECAP expression is supposed to subtract CUR_YR from LAST_YR and NEXT_YR.

```
SET CNOTATION = ALL
DEFINE FILE LEDGER
CUR_YR/I7C = AMOUNT;
LAST_YR/I5C = .87*CUR_YR - 142;
NEXT_YR/I5C = 1.13*CUR_YR + 222;
END
TABLE FILE LEDGER
SUM CUR_YR/I5C NOPRINT LAST_YR NEXT_YR
FOR ACCOUNT
10$$ AS 'TOTAL CASH ' LABEL TOTCASH OVER
" " OVER RECAP CHGCASH(1,3)/I5SC=(TOTCASH(*) - TOTCASH(1));
AS 'CHANGE FROM CURRENT'
END
```
When CNOTATION = ALL, C1 refers to the CUR_YR field with its original format, C2 refers to the reformatted value, C3 is LAST_YR, and C4 is NEXT_YR. Since there is an extra column and the RECAP only refers to columns 1 and 3, the calculation for NEXT_YR - CUR_YR is not performed. The output is:

<table>
<thead>
<tr>
<th></th>
<th>LAST_YR</th>
<th>NEXT_YR</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOTAL CASH</td>
<td>17,195</td>
<td>25,991</td>
</tr>
<tr>
<td>CHANGE FROM CURRENT</td>
<td>-4,044</td>
<td></td>
</tr>
</tbody>
</table>

When CNOTATION = PRINTONLY, the CUR_YR field is not assigned any column number, so there is no column 3. Therefore, no calculations are performed. The output is:

<table>
<thead>
<tr>
<th></th>
<th>LAST_YR</th>
<th>NEXT_YR</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOTAL CASH</td>
<td>17,195</td>
<td>25,991</td>
</tr>
<tr>
<td>CHANGE FROM CURRENT</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When CNOTATION = EXPLICIT, the reformatted version of the CUR_YR field is C1 because it is referenced in the request even though it is not displayed. Both calculations are performed correctly. The output is:

<table>
<thead>
<tr>
<th></th>
<th>LAST_YR</th>
<th>NEXT_YR</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOTAL CASH</td>
<td>17,195</td>
<td>25,991</td>
</tr>
<tr>
<td>CHANGE FROM CURRENT</td>
<td>-4,044</td>
<td>4,752</td>
</tr>
</tbody>
</table>

Controlling Underlining of ACROSS Objects

**How to:**

Control Underlining for ACROSS Objects

**Example:**

Underlining ACROSS Objects With a Dashed Line (SET ACROSSLINE=ON)

Removing Underlines for ACROSS Objects (SET ACROSSLINE=SKIP)

Replacing the Underline With a Blank Line (SET ACROSSLINE=OFF)

The SET ACROSSLINE command allows users to turn off/on optional underlining in reports to highlight ACROSS objects. The feature is only available for Hotscreen reports and report output formats WP, HTML and PDF.
Syntax: **How to Control Underlining for ACROSS Objects**

Issue the following command in any supported profile, or in a focexec, or at the command prompt:

```
SET ACROSSLINE= (ON|OFF|SKIP)
```

where:

**ON**
Underlines ACROSS objects in report headings with a dashed line. ON is the default value.

**OFF**
Replaces the underline with a blank line.

**SKIP**
Specifies no underline and no blank line.

Example: **Underlining ACROSS Objects With a Dashed Line (SET ACROSSLINE=ON)**

```
SET ACROSSLINE=ON
TABLE FILE GGSALES
SUM UNITS BY PRODUCT
ACROSS REGION
END
```

The output is:

<table>
<thead>
<tr>
<th>Product</th>
<th>Midwest</th>
<th>Northeast</th>
<th>Southeast</th>
<th>West</th>
</tr>
</thead>
<tbody>
<tr>
<td>Biscotti</td>
<td>86105</td>

</tbody>
</table>
Controlling Underlining of ACROSS Objects

**Example: Removing Underlines for ACROSS Objects (SET ACROSSLINE=SKIP)**

```sql
SET ACROSSLINE=SKIP
TABLE FILE GGSALES
SUM UNITS BY PRODUCT
ACROSS REGION
END
```

The output is:

<table>
<thead>
<tr>
<th>Product</th>
<th>Midwest</th>
<th>Northeast</th>
<th>Southeast</th>
<th>West</th>
</tr>
</thead>
<tbody>
<tr>
<td>Biscotti</td>
<td>86105</td>
<td>145242</td>
<td>119594</td>
<td>70436</td>
</tr>
<tr>
<td>Cappuccino</td>
<td>.</td>
<td>44785</td>
<td>73264</td>
<td>71168</td>
</tr>
<tr>
<td>Coffee Grinder</td>
<td>50393</td>
<td>40977</td>
<td>47083</td>
<td>48081</td>
</tr>
<tr>
<td>Coffee Pot</td>
<td>47156</td>
<td>46185</td>
<td>49922</td>
<td>47432</td>
</tr>
<tr>
<td>Croissant</td>
<td>139182</td>
<td>137394</td>
<td>156456</td>
<td>197022</td>
</tr>
<tr>
<td>Espresso</td>
<td>101154</td>
<td>68127</td>
<td>68030</td>
<td>71675</td>
</tr>
<tr>
<td>Latte</td>
<td>231623</td>
<td>222866</td>
<td>209654</td>
<td>213920</td>
</tr>
<tr>
<td>Mug</td>
<td>86718</td>
<td>91497</td>
<td>88474</td>
<td>93881</td>
</tr>
<tr>
<td>Scone</td>
<td>116127</td>
<td>70732</td>
<td>73779</td>
<td>72776</td>
</tr>
<tr>
<td>Thermos</td>
<td>46587</td>
<td>48870</td>
<td>48976</td>
<td>45648</td>
</tr>
</tbody>
</table>

**Example: Replacing the Underline With a Blank Line (SET ACROSSLINE=OFF)**

```sql
SET ACROSSLINE=OFF
TABLE FILE GGSALES
SUM UNITS BY PRODUCT
ACROSS REGION
END
```

Turning ACROSSLINE=OFF replaces the (default) dashed line with an extra blank line between the report heading and the detail lines:

<table>
<thead>
<tr>
<th>Product</th>
<th>Midwest</th>
<th>Northeast</th>
<th>Southeast</th>
<th>West</th>
</tr>
</thead>
<tbody>
<tr>
<td>Biscotti</td>
<td>86105</td>
<td>145242</td>
<td>119594</td>
<td>70436</td>
</tr>
<tr>
<td>Cappuccino</td>
<td>.</td>
<td>44785</td>
<td>73264</td>
<td>71168</td>
</tr>
<tr>
<td>Coffee Grinder</td>
<td>50393</td>
<td>40977</td>
<td>47083</td>
<td>48081</td>
</tr>
<tr>
<td>Coffee Pot</td>
<td>47156</td>
<td>46185</td>
<td>49922</td>
<td>47432</td>
</tr>
<tr>
<td>Croissant</td>
<td>139182</td>
<td>137394</td>
<td>156456</td>
<td>197022</td>
</tr>
<tr>
<td>Espresso</td>
<td>101154</td>
<td>68127</td>
<td>68030</td>
<td>71675</td>
</tr>
<tr>
<td>Latte</td>
<td>231623</td>
<td>222866</td>
<td>209654</td>
<td>213920</td>
</tr>
<tr>
<td>Mug</td>

</tbody>
</table>
Combinations of Summary Commands

**How to:**
Use Summary Commands

**Reference:**
Usage Notes for Combinations of Summary Commands

**Example:**
Using SUBTOTAL and RECOMPUTE in a Request
Using SUB-TOTAL With Multiple Summary Commands
Using Multiple Summary Commands With Prefix Operators
Propagation of Summary Commands With Field Lists

You can specify a different summary operation for each sort break (BY field). In prior releases, only one summary command (SUBTOTAL, SUB-TOTAL, SUMMARIZE, or RECOMPUTE) was supported in a request.

If you have multiple summary commands for the same sort field, the following message displays and the last summary command specified in the request is used:

(FOC36359) MORE THAN 1 SUBTOTAL/SUB-TOTAL/RECOMPUTE/SUMMARIZE
There is more than one SUBTOTAL/SUB-TOTAL/RECOMPUTE/SUMMARIZE on the same key field which is not allowed. The last one specified will override the rest.

SUMMARIZE and SUB-TOTAL, which propagate their summary operations to higher level sort breaks, skip those fields at higher level sort breaks that have their own summary commands. The propagation of summary operations depends on whether prefix operator processing is used for summary lines. If prefix operators are:

- Not used on summary lines or if you issue the SET SUMMARYLINES=OLD command, prefix operator processing is not used for the request. In this case, if any summary command specifies a field list, only the fields specified on the summary line field lists are populated on the report.
Combinations of Summary Commands

- Used on summary lines or if you issue the SET SUMMARYLINES=NEW command, prefix operator processing is used for the request. In this case, SUB-TOTAL and SUMMARIZE propagate to:
  - All fields at higher level sort breaks that do not have their own summary command.
  - Fields not specified in the field list at higher level sort breaks that do have their own summary commands (columns that would have been empty). Note that this is the only technique that allows different fields at the same sort break to have different summary options.

Prefix operators on summary lines result in the same values whether the command is RECOMPUTE/SUMMARIZE or SUBTOTAL/SUB-TOTAL. For a computed field, the prefix operator is not applied, the value is recalculated using the expression in the COMPUTE command and the values from the summary line.

When you use different summary commands for different sort fields, the default grand total row inherits the summary command associated with the first sort field in the request. You can change the operation performed at the grand total level by using the ON TABLE phrase to specify a specific summary command.

**Note:** The grand total is considered the highest sort level. Therefore, although you can use the SUMMARIZE or SUB-TOTAL command at the grand total level, these commands apply only to the grand total and are not propagated to any other line on the report. On the grand total level SUMMARIZE operates as a RECOMPUTE command, and SUB-TOTAL operates as a SUBTOTAL command.

**Syntax:** How to Use Summary Commands

At a sort break, use the following syntax:

```
{BY|ON} breakfield [AS 'text1'] sumoption [MULTILINES]
    [pref.] [*|[field1 [[pref2.]field2 ...]]]]
    [AS 'text2'] [WHEN expression;]
```

To replace the default grand total, use the following syntax

```
ON TABLE sumoption [pref.][field1 [[pref2.]field2 ...]] [AS 'text2']
```

where:

- **breakfield**
  - Is the sort field whose change in value triggers the summary operation.

- **sumoption**
  - Can be one of the following: SUBTOTAL, SUB-TOTAL, RECOMPUTE, or SUMMARIZE.

- **'text1'**
  - Is the column heading to use for the break field on the report output.
MULTILINES
Suppresses the printing of a summary line for every sort break that has only one detail line. Note that MULTILINES suppresses the summary line even if a prefix operator is used to specify a different operation for the summary line. MULTI-LINES is a synonym for MULTILINES.

pref.
Is a prefix operator. When specified without a field list, the prefix operator is applied to every numeric column in the report output and every numeric column is populated with values on the summary row.

*
Includes all display fields on the summary line. If a prefix operator is specified, it is applied to all fields. If the prefix operator is not supported with alphanumeric fields, alphanumeric fields are not included on the summary line.

[field1 [field2 ... fieldn]]
Produces the type of summary specified by sumoption for the listed fields. If no field names are listed, the summary is produced for every numeric column in the report output.

pref. field1 [field2 ... fieldn] [pref2. fieldm ...]
The first prefix operator is applied to field1 through fieldn. The second prefix operator is applied to fieldm. Only the fields specified are populated with values on the summary row. Each prefix operator must be separated by a blank space from the following field name.

'text2'
Is the text that prints on the left of the summary row.

expression
Is an expression that determines whether the summary operation is performed at each break.
Example: **Using SUBTOTAL and RECOMPUTE in a Request**

In the following request, the first sort field specified is COPIES, which is associated with the RECOMPUTE command. Therefore, on the grand total line, the value of RATIO is correctly recomputed and the values of LISTPR and WHOLESALEPR are summed (because this is the default operation when the field is not calculated by a COMPUTE command).

TABLE FILE MOVIES
PRINT DIRECTOR LISTPR WHOLESALEPR
COMPUTE RATIO = LISTPR/WHOLESALEPR;
BY COPIES
BY RATING
WHERE COPIES LT 3
WHERE DIRECTOR EQ 'DISNEY W.' OR 'HITCHCOCK A.'
ON COPIES RECOMPUTE AS '*REC: '
ON RATING SUBTOTAL AS '*SUB: '
END

The output is:

<table>
<thead>
<tr>
<th>COPIES</th>
<th>RATING</th>
<th>DIRECTOR</th>
<th>LISTPR</th>
<th>WHOLESALEPR</th>
<th>RATIO</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>NR</td>
<td>DISNEY W.</td>
<td>29.95</td>
<td>15.99</td>
<td>1.87</td>
</tr>
<tr>
<td>*REC:</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>29.95</td>
<td>15.99</td>
<td>1.87</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| 2      | NR     | HITCHCOCK A.    | 19.98  | 9.00        | 2.22  |
| *REC:  |        |                 |        |             |       |
|        |        |                 | 19.98  | 9.00        | 2.22  |
|        |        |                 |        |             |       |
|        | PG     | HITCHCOCK A.    | 19.98  | 9.00        | 2.22  |
| *REC:  |        |                 |        |             |       |
|        |        |                 | 19.98  | 9.00        | 2.22  |
|        |        |                 |        |             |       |
|        |        |                 | 39.96  | 18.00       | 4.44  |
| *REC:  |        |                 |        |             |       |
|        |        |                 | 39.96  | 18.00       | 4.44  |
|        |        |                 |        |             |       |
|        | 2 PG13 | HITCHCOCK A.    | 19.98  | 9.00        | 2.22  |
| *REC:  |        |                 |        |             |       |
|        |        |                 | 19.98  | 9.00        | 2.22  |

TOTAL: 129.85 60.99 2.13
If you reverse the BY fields, the grand total line sums the RATIO values as well as the LISTPR and WHOLESALEPR values because the SUBTOTAL command controls the grand total line:

```
TOTAL                              129.85        60.99           12.97
```

You can change the operation performed at the grand total level by adding the following command to the request:

```
ON TABLE RECOMPUTE
```

The grand total line then displays the recomputed values:

```
TOTAL                              129.85        60.99            2.13
```

**Example: Using SUB-TOTAL With Multiple Summary Commands**

In the following request, the SUB-TOTAL command propagates its operation to the DIRECTOR sort field (see the total line for HITCHCOCK, on which the RATIO values are subtotaled, not recomputed).

SUB-TOTAL is not propagated to the RATING sort field which has its own RECOMPUTE command, and for this sort field the RATIO value is recomputed.

The grand total line is recomputed because RECOMPUTE is performed on a higher level sort field than SUB-TOTAL.

```
TABLE FILE MOVIES
PRINT LISTPR WHOLESALEPR
COMPUTE RATIO = LISTPR/WHOLESALEPR;
BY DIRECTOR
BY RATING
BY COPIES
WHERE COPIES LT 3
WHERE DIRECTOR EQ 'HITCHCOCK A.'
ON COPIES SUB-TOTAL AS '*SUB: '
ON RATING RECOMPUTE AS '*REC: '
END
```
The output is:

<table>
<thead>
<tr>
<th>DIRECTOR</th>
<th>RATING</th>
<th>COPIES</th>
<th>LISTPR</th>
<th>WHOLESALEPR</th>
<th>RATIO</th>
</tr>
</thead>
<tbody>

<tr>
<td>TOTAL</td>
<td></td>
<td></td>
<td>99.90</td>
<td>45.00</td>
<td>2.22</td>
</tr>
</tbody>
</table>
Example: Using Multiple Summary Commands With Prefix Operators

The following request prints the average value of LISTPR and the recomputed value of RATIO on the lines associated with sort field RATING. The SUB-TOTAL command associated with sort field COPIES is propagated to all fields on the DIRECTOR sort field lines and to the WHOLESALEPR and RATIO1 columns associated with the RATING sort field. The grand total line is suppressed for this request.

```
TABLE FILE MOVIES
PRINT LISTPR WHOLESALEPR
COMPUTE RATIO/D6.2 = LISTPR/WHOLESALEPR;
COMPUTE RATIO1/D6.2 = LISTPR/WHOLESALEPR;
BY DIRECTOR
BY RATING
BY COPIES
WHERE COPIES LT 3
   WHERE DIRECTOR EQ 'KAZAN E.'
     ON RATING RECOMPUTE AVE. LISTPR RATIO AS '*REC: ';
     ON COPIES SUB-TOTAL                     AS '*SUB: ';
     ON TABLE NOTOTAL
END
```

On the output:

- The values of WHOLESALEPR and RATIO1 on the row labeled *REC are subtotals because of propagation of the SUB-TOTAL command to the fields not specified in the RECOMPUTE command.
- The LISTPR value is an average and the value of RATIO (which has the same definition as RATIO1) is recomputed because these two fields are specified in the RECOMPUTE command.
- The SUB-TOTAL command is propagated to the DIRECTOR row.

The output is:

<table>
<thead>
<tr>
<th>DIRECTOR</th>
<th>RATING</th>
<th>COPIES</th>
<th>LISTPR</th>
<th>WHOLESALEPR</th>
<th>RATIO</th>
<th>RATIO1</th>
</tr>
</thead>
<tbody>
<tr>
<td>KAZAN E.</td>
<td>NR</td>
<td>1</td>
<td>24.98</td>
<td>14.99</td>
<td>1.67</td>
<td>1.67</td>
</tr>
<tr>
<td>*SUB:</td>
<td>1</td>
<td></td>
<td>24.98</td>
<td>14.99</td>
<td>1.67</td>
<td>1.67</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2</td>
<td>19.95</td>
<td>9.99</td>
<td>2.00</td>
<td>2.00</td>
</tr>
<tr>
<td>*SUB:</td>
<td>2</td>
<td></td>
<td>19.95</td>
<td>9.99</td>
<td>2.00</td>
<td>2.00</td>
</tr>
<tr>
<td>*REC:</td>
<td>NR</td>
<td></td>
<td>22.46</td>
<td>24.98</td>
<td>.90</td>
<td>3.66</td>
</tr>
<tr>
<td>*TOTAL DIRECTOR KAZAN E.</td>
<td></td>
<td></td>
<td>44.93</td>
<td>24.98</td>
<td>3.66</td>
<td>3.66</td>
</tr>
</tbody>
</table>
Example:  Propagation of Summary Commands With Field Lists

In the following request, the RECOMPUTE command has a field list.

```
SET SUMMARYLINES = OLD
TABLE FILE MOVIES
PRINT LISTPR WHOLESALEPR
COMPUTE RATIO/D6.2 = LISTPR/WHOLESALEPR;
COMPUTE RATIO1/D6.2 = LISTPR/WHOLESALEPR;
BY DIRECTOR
BY RATING
BY COPIES
WHERE COPIES LT 3
    WHERE DIRECTOR EQ 'KAZAN E.'
    ON RATING RECOMPUTE LISTPR RATIO AS '*REC:  '
    ON COPIES SUB-TOTAL AS '*SUB:  '
END
```

With SUMMARYLINES=OLD, only those fields have values on the report output:

<table>
<thead>
<tr>
<th>DIRECTOR</th>
<th>RATING</th>
<th>COPIES</th>
<th>LISTPR</th>
<th>WHOLESALEPR</th>
<th>RATIO</th>
<th>RATIO1</th>
</tr>
</thead>
<tbody>
<tr>
<td>KAZAN E.</td>
<td>NR</td>
<td>1</td>
<td>24.98</td>
<td>14.99</td>
<td>1.67</td>
<td>1.67</td>
</tr>
<tr>
<td>*SUB:</td>
<td>1</td>
<td></td>
<td>24.98</td>
<td></td>
<td>1.67</td>
<td></td>
</tr>
<tr>
<td>*SUB:</td>
<td>2</td>
<td></td>
<td>19.95</td>
<td>9.99</td>
<td>2.00</td>
<td>2.00</td>
</tr>
<tr>
<td>*REC:</td>
<td>NR</td>
<td></td>
<td>44.93</td>
<td></td>
<td>1.80</td>
<td></td>
</tr>
<tr>
<td>*TOTAL DIRECTOR KAZAN E.</td>
<td></td>
<td></td>
<td>44.93</td>
<td></td>
<td>3.66</td>
<td></td>
</tr>
</tbody>
</table>

TOTAL

44.93 1.80
With `SUMMARYLINES=NEW`, `SUB-TOTAL` propagates to all of the columns that would otherwise be unpopulated. The grand total line inherits the `RECOMPUTE` command for the fields listed in its field list, and the `SUB-TOTAL` command propagates to the other columns:

<table>
<thead>
<tr>
<th>DIRECTOR</th>
<th>RATING</th>
<th>COPIES</th>
<th>LISTPR</th>
<th>WHOLESALEPR</th>
<th>RATIO</th>
<th>RATIO1</th>
</tr>
</thead>
<tbody>
<tr>
<td>KAZAN E.</td>
<td>NR</td>
<td>1</td>
<td>24.98</td>
<td>14.99</td>
<td>1.67</td>
<td>1.67</td>
</tr>
<tr>
<td>*SUB: 1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>2</td>
<td>24.98</td>
<td>14.99</td>
<td>1.67</td>
<td>1.67</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2</td>
<td>19.95</td>
<td>9.99</td>
<td>2.00</td>
<td>2.00</td>
</tr>
<tr>
<td>*SUB: 2</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>*REC: NR</td>
<td></td>
<td></td>
<td>44.93</td>
<td>24.98</td>
<td>1.80</td>
<td>3.66</td>
</tr>
<tr>
<td>*TOTAL DIRECTOR KAZAN E.</td>
<td></td>
<td></td>
<td>44.93</td>
<td>24.98</td>
<td>1.80</td>
<td>3.66</td>
</tr>
<tr>
<td>TOTAL</td>
<td></td>
<td></td>
<td>44.93</td>
<td>24.98</td>
<td>1.80</td>
<td>3.66</td>
</tr>
</tbody>
</table>

**Reference: Usage Notes for Combinations of Summary Commands**

- Summary processing differs for summary commands that have prefix operators and summary lines that do not use prefix operators (see the *Creating Reports* manual for details). If any summary command uses prefix operators, the entire request uses prefix operator processing. If processing without prefix operators is initiated, but a subsequent field requires prefix operator processing, the following message is generated and processing halts:

  (FOC36376) CANNOT COMBINE SUBTOTAL/RECOMPUTE STYLES WHEN SUMMARYLINES=OLD

  You can prevent this message by setting `SUMMARYLINES=NEW` to invoke prefix operator processing.

- `SET SUMMARYLINES=EXPLICIT` affects propagation of summary commands to the grand total line by making it consistent with the behavior for any sort break. Therefore, with this setting in effect, `SUB-TOTAL` and `SUMMARIZE` propagate to the grand total line but `SUBTOTAL` and `RECOMPUTE` do not.
Producing Summary Columns for Horizontal Sort Fields

**How to:**
Produce a Summary Operation on a Horizontal Sort Field

**Example:**
Using Summary Commands With ACROSS

**Reference:**
Usage Notes for Summaries on ACROSS Fields

The summary commands SUBTOTAL, SUB-TOTAL, SUMMARIZE, and RECOMPUTE can be used with horizontal sort breaks.

**Syntax:**

```
{ACROSS|ON} breakfield [AS 'text1'] sumoption [AS 'text2']
[COLUMNS c1 [AND c2 ...]]
```

where:

**breakfield**
Is the ACROSS field whose for which you want to generate the summary option. The end of the values for the ACROSS field triggers the summary operation.

**sumoption**
Can be one of the following: SUBTOTAL, SUB-TOTAL, RECOMPUTE, or SUMMARIZE.

'\text1'
Is the column heading to use for the break field on the report output.

'\text2'
Is the text that prints on the top of the summary column.

**COLUMNS c1, c2 ...**
Lists the specific ACROSS values that you want to display on the report output in the order in which you want them. This list of values cannot be specified in an ON phrase. If it is specified in an ACROSS phrase, it must be the last option specified in the ACROSS phrase.
Reference: Usage Notes for Summaries on ACROSS Fields

- SUMMARIZE and SUB-TOTAL operate on the ACROSS field for which they are specified and for all higher level ACROSS fields. They do not operate on BY fields. SUBTOTAL and RECOMPUTE operate only on the ACROSS field for which they are specified.

- SUMMARIZE and SUB-TOTAL commands specified for a BY field operate on that BY and all higher level BY fields. They do not operate on ACROSS fields.

- ROW-TOTAL, ACROSS-TOTAL, SUBTOTAL, and SUB-TOTAL sum the values in the columns. Unlike SUMMARIZE and RECOMPUTE, they do not reapply calculations other than sums.

- Summary commands specified in an ON TABLE phrase operate on columns, not rows.

Example: Using Summary Commands With ACROSS

The following request sums units and dollars and calculates the unit cost by product and across region and month. The ACROSS MNTH RECOMPUTE command creates totals of units and dollars, and recomputes the calculated value for the selected months within regions. The ACROSS REGION RECOMPUTE command does the same for the selected regions. The ON TABLE SUMMARIZE command creates summary rows. It has no effect on columns:

```
DEFINE FILE GGSALES
MNTH/MTr = DATE;
END
TABLE FILE GGSALES
SUM
  UNITS/I5 AS 'UNITS' OVER
  DOLLARS/I6 AS 'DOLLARS' OVER
  COMPUTE DOLLPER/I6 = DOLLARS/UNITS; AS 'UNIT COST'
BY PRODUCT
ACROSS REGION RECOMPUTE AS 'Region Sum' COLUMNS 'Northeast' AND 'West'
ACROSS MNTH RECOMPUTE AS 'Month Sum' COLUMNS 'November' AND 'December'
WHERE DATE FROM '19971101' TO '19971231';
WHERE PRODUCT EQ 'Capuccino' OR 'Espresso';
ON TABLE SUMMARIZE AS 'Grand Total'
ON TABLE HOLD FORMAT HTML
END
```
Joining to a Fixed Format Sequential File Based on Multiple Fields

The output is:

<table>
<thead>
<tr>
<th>Region</th>
<th>Northeast</th>
<th>West</th>
<th>Region</th>
<th>Sum</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNIT COST</td>
<td>11</td>
<td>11</td>
<td>11</td>
<td>12</td>
</tr>
<tr>
<td>DOLLARS</td>
<td>23829</td>
<td>30605</td>
<td>54234</td>
<td>3613</td>
</tr>
<tr>
<td>UNIT COST</td>
<td>12</td>
<td>12</td>
<td>12</td>
<td>11</td>
</tr>
<tr>
<td>DOLLARS</td>
<td>49823</td>
<td>44273</td>
<td>93856</td>
<td>6727</td>
</tr>
</tbody>
</table>

Joining to a Fixed Format Sequential File Based on Multiple Fields

**How to:**
Join to a Fixed Format Sequential File Based on Multiple Fields

**Example:**
Joining to a Fixed Format Sequential Data Source Using Two Join Fields

**Reference:**
Usage Notes for Multi-Field Joins TO Fixed Format Sequential Files

A fixed format sequential data source can be the host or cross-referenced file in a join based on multiple fields. In a join TO a fixed format sequential file, both files that participate in the join must be sorted in ascending order of the concatenation of join fields and the sequential file must consist of a single segment.
### Syntax: How to Join to a Fixed Format Sequential File Based on Multiple Fields

JOIN field1 AND field2 [AND field3 [AND field4]] IN file1
TO {ALL|MULTIPLE|UNIQUE} field1a AND field2a [AND field3a [AND field4a]]
IN file2 AS joinname
END

where:

**file1**
Is the host file.

**file2**
Is a single segment fixed format sequential file to be used as the cross referenced file.

**field1, ... field4**
Are up to four fields in the host file.

**field1a, ... field4a**
Are fields in the cross referenced file. Each join field must share formats and values with its corresponding field in the host file. The number of join fields in the cross referenced file must be the same as the number of join fields in the host file. The file must be sorted by the concatenation of the join fields.

**joinname**
Is a name assigned to the join.

**ALL|MULTIPLE**
Specifies a one-to-many join. All matching records in the cross referenced file will be retrieved.

**UNIQUE**
Specifies a one-to-one join. At most one matching record in the cross referenced file will be retrieved.

**END**
Is required to terminate the JOIN command if it spans multiple lines.

### Reference: Usage Notes for Multi-Field Joins TO Fixed Format Sequential Files

- Both files participating in the JOIN must be in ascending sequence of the concatenation of join fields.
- A many-to-many JOIN is not supported.
- A fixed format sequential data source used as the cross-referenced file in the join must consist of a single segment.
Example: Joining to a Fixed Format Sequential Data Source Using Two Join Fields

The following request creates a fixed format sequential file named FIXSALE from the GGSALES data source. This file is sorted by store code and state:

```
SET ASNAMES = ON
TABLE FILE GGSALES
SUM PCD PRODUCT CATEGORY UNITS DOLLARS
BY STCD BY ST
ON TABLE HOLD AS FIXSALE FORMAT ALPHA
END
```

The following JOIN command joins the GGSTORES data source to the FIXSALE sequential file using two join fields. Both data sources are sorted on these join fields, store code and state:

```
JOIN STORE_CODE AND STATE IN GGSTORES
TO STCD AND ST IN FIXSALE AS JOIN1
END
```

The following request reports from the joined data source. The store name and zip code fields are from the GGSTORES data source and the UNITS and DOLLARS fields are from the FIXSALE file:

```
TABLE FILE GGSTORES
PRINT STORE_NAME ZIP UNITS DOLLARS
BY STORE_CODE BY ST
END
```

The output is:

```
Store ID  ST  Store Name               Zip Code     UNITS   DOLLARS
--------  --  ----------               --------     -----   -------
R1019     TX  GOTHAM GRINDS #1019      77201       299737   3714978

```
Ranking Sort Field Values With the RNK. Prefix Operator

How to:
Calculate Ranks Using the RNK. Prefix Operator

Example:
Ranking Within Sort Groups
Using RNK. in a WHERE TOTAL Test
Using RNK. in a COMPUTE Command

RANKED BY fieldname, when used in a sort phrase in a TABLE request, not only sorts the data by the specified field, but assigns a RANK value to the instances. The RNK. prefix operator also calculates the rank while allowing the RANK value to be printed anywhere on the page. You use this operator by specifying RNK.fieldname, where fieldname is a BY field in the request.

The ranking process occurs after selecting and sorting records. Therefore, the RNK. operator cannot be used in a WHERE or IF selection test or in a virtual (DEFINE) field. However, RNK.fieldname can be used in a WHERE TOTAL or IF TOTAL test or in a calculated (COMPUTE) value. You can change the default column title for the rank field using an AS phrase.

You can apply the RNK. operator to multiple sort fields, in which case the rank for each BY field is calculated within its higher level BY field.

Syntax: How to Calculate Ranks Using the RNK. Prefix Operator

In a PRINT command, COMPUTE expression, or IF/WHERE TOTAL expression:

RNK.field ... 

where:

field

Is a vertical (BY) sort field in the request.
**Example: Ranking Within Sort Groups**

The following request ranks years of service within department and ranks salary within years of service and department. Note that years of service depends on the value of TODAY. The output for this example was valid when run in September, 2006:

```
DEFINE FILE EMPDATA
  TODAY/YYMD = &YYMD;
  YRS_SERVICE/I9 = DATEDIF(HIREDATE,TODAY,'Y');
END
TABLE FILE EMPDATA
PRINT SALARY
  RNK.YRS_SERVICE AS 'RANKING,BY,SERVICE'
  RNK.SALARY AS 'SALARY,RANK'
  BY DEPT
    BY HIGHEST YRS_SERVICE
    BY HIGHEST SALARY NOPRINT
WHERE DEPT EQ 'MARKETING' OR 'SALES'
ON TABLE SET PAGE NOPAGE
END
```

The output is:

<table>
<thead>
<tr>
<th>DEPT</th>
<th>YRS_SERVICE</th>
<th>SALARY</th>
<th>SERVICE</th>
<th>RANK</th>
</tr>
</thead>
<tbody>
<tr>
<td>MARKETING</td>
<td>17</td>
<td>$55,500.00</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>16</td>
<td>$62,500.00</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>16</td>
<td>$62,500.00</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>15</td>
<td>$50,500.00</td>
<td>3</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>15</td>
<td>$43,400.00</td>
<td>3</td>
<td>2</td>
</tr>
<tr>
<td>SALES</td>
<td>17</td>
<td>$115,000.00</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>16</td>
<td>$70,000.00</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>15</td>
<td>$43,600.00</td>
<td>3</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>15</td>
<td>$30,500.00</td>
<td>3</td>
<td>2</td>
</tr>
</tbody>
</table>

Information Builders
Example: Using RNK. in a WHERE TOTAL Test

The following request displays only those rows in the highest two salary ranks within the years of service category. Note that years of service depends on the value of TODAY. The output for this example was valid when run in September, 2006::

```
DEFINE FILE EMPDATA
   TODAY/YYMD = &YYMD;
   YRS_SERVICE/I9 = DATEDIF(HIREDATE,TODAY,'Y');
END
TABLE FILE EMPDATA
PRINT LASTNAME FIRSTNAME RNK.SALARY
BY HIGHEST YRS_SERVICE BY HIGHEST SALARY
WHERE TOTAL RNK.SALARY LE 2
END
```

The output is:

<table>
<thead>
<tr>
<th>YRS_SERVICE</th>
<th>SALARY</th>
<th>LASTNAME</th>
<th>FIRSTNAME</th>
<th>RANK</th>
</tr>
</thead>
<tbody>
<tr>
<td>17</td>
<td>$115,000.00</td>
<td>LASTRA</td>
<td>KAREN</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>$80,500.00</td>
<td>NOZAWA</td>
<td>JIM</td>
<td>2</td>
</tr>
<tr>
<td>16</td>
<td>$83,000.00</td>
<td>SANCHEZ</td>
<td>EVELYN</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>$70,000.00</td>
<td>CASSANOVA</td>
<td>LOIS</td>
<td>2</td>
</tr>
<tr>
<td>15</td>
<td>$62,500.00</td>
<td>HIRSCHMAN</td>
<td>ROSE</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>$50,500.00</td>
<td>WANG</td>
<td>JOHN</td>
<td>1</td>
</tr>
</tbody>
</table>

Note: The output was valid when run in September, 2006.
**Example: Using RNK in a COMPUTE Command**

The following request sets a flag to Y for records in which the salary rank within department is less than or equal to 5 and the rank of years of service within salary and department is less than or equal to 6. Otherwise, the flag has the value N. Note that years of service depends on the value of TODAY. The output for this example was valid when run in September, 2006:

```plaintext
DEFINE FILE EMPDATA
    TODAY/YYMD = &YYMD;
    YRS_SERVICE/I9 = DATEDIF(HIREDATE,TODAY,'Y');
END
PRINT RNK.SALARY RNK.YRS_SERVICE
COMPUTE FLAG/A1 = IF RNK.SALARY LE 5  AND RNK.YRS_SERVICE LE 6
    THEN 'Y' ELSE 'N';
BY DEPT BY SALARY BY YRS_SERVICE
WHERE DEPT EQ 'MARKETING' OR 'SALES'
ON TABLE SET PAGE NOPAGE
END
```

The output is:

<table>
<thead>
<tr>
<th>DEPT</th>
<th>SALARY</th>
<th>YRS_SERVICE</th>
<th>RANK</th>
<th>RANK</th>
<th>FLAG</th>
</tr>
</thead>
<tbody>
<tr>
<td>MARKETING</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>

Displaying a Row for Data Excluded by a Sort Phrase (PLUS OTHERS)

How to:
Display Data Excluded by a Sort Phrase

Example:
Displaying a Row Representing Sort Field Values Excluded by a Sort Phrase
Displaying a Row Representing Data Not Included in Any Sort Field Grouping

Reference:
Usage Notes for PLUS OTHERS

In a sort phrase, you can restrict the number of sort values displayed. With the PLUS OTHERS phrase, you can aggregate all other values to a separate group and display this group as an additional report row.

Syntax: How to Display Data Excluded by a Sort Phrase

[RANKED] BY {HIGHEST|LOWEST|TOP|BOTTOM} n srtfield [AS 'text']
[PLUS OTHERS AS 'othertext']
[IN-GROUPS-OF m1 [TOP n2]]
[IN-RANGES-OF m3 [TOP n4]]

where:

LOWEST
Sorts in ascending order, beginning with the lowest value and continuing to the highest value (a-z, A-Z, 0-9 for alphanumeric fields; 0-9 for numeric fields). BOTTOM is a synonym for LOWEST.

HIGHEST
Sorts in descending order, beginning with the highest value and continuing to the lowest value. TOP is a synonym for HIGHEST.

n
Specifies that only n sort field values are included in the report

srtfield
Is the name of the sort field.

text
Is the text to be used as the column heading for the sort field values.
Displaying a Row for Data Excluded by a Sort Phrase (PLUS OTHERS)

othertext
Is the text to be used as the row title for the “others” grouping. This AS phrase must be the AS phrase immediately following the PLUS OTHERS phrase.

m1
Is the incremental value between sort field groups.

n2
Is an optional number that defines the highest group label to be included in the report.

m3
Is an integer greater than zero indicating the range by which sort field values are grouped.

n4
Is an optional number that defines the highest range label to be included in the report. The range is extended to include all data values higher than this value.

Reference: Usage Notes for PLUS OTHERS

- Alphanumeric group keys are not supported.
- Only one PLUS OTHERS phrase is supported in a request.
- In a request with multiple display commands, the BY field that has the PLUS OTHERS phrase does not have to be the last BY field in the request.
- The BY ROWS OVER, TILES, ACROSS, and BY TOTAL phrases are not supported with PLUS OTHERS.
- PLUS OTHERS is not supported in a MATCH FILE request. However, MORE in a TABLE request is supported.
- HOLD is supported for formats PDF, PS, HTML, DOC, and WP.
**Example: Displaying a Row Representing Sort Field Values Excluded by a Sort Phrase**

The following request displays the top two ED_HRS values and aggregates the values not included in a row labeled Others:

```
TABLE FILE EMPLOYEE
PRINT CURR_SAL LAST_NAME
  BY HIGHEST 2 ED_HRS
    PLUS OTHERS AS 'Others'
END
```

The output is:

<table>
<thead>
<tr>
<th>ED_HRS</th>
<th>CURR_SAL</th>
<th>LAST_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>------</td>
<td>----------</td>
<td>---------</td>
</tr>
<tr>
<td>75.00</td>
<td>$21,780.00</td>
<td>BLACKWOOD</td>
</tr>
<tr>
<td>50.00</td>
<td>$18,480.00</td>
<td>JONES</td>
</tr>
<tr>
<td></td>
<td>$16,100.00</td>
<td>MCKNIGHT</td>
</tr>
</tbody>
</table>

**Example: Displaying a Row Representing Data Not Included in Any Sort Field Grouping**

The following request sorts by highest 2 ED_HRS and groups the sort field values by increments of 25 ED_HRS. Values that fall below the lowest group label are included in the Others category. All values above the top group label are included in the top group:

```
TABLE FILE EMPLOYEE
PRINT CURR_SAL LAST_NAME
  BY HIGHEST 2 ED_HRS
    PLUS OTHERS AS 'Others'
    IN-GROUPS-OF 25 TOP 50
END
```

The output is:

<table>
<thead>
<tr>
<th>ED_HRS</th>
<th>CURR_SAL</th>
<th>LAST_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>------</td>
<td>----------</td>
<td>---------</td>
</tr>
<tr>
<td>50.00</td>
<td>$18,480.00</td>
<td>JONES</td>
</tr>
<tr>
<td></td>
<td>$21,780.00</td>
<td>BLACKWOOD</td>
</tr>
<tr>
<td></td>
<td>$16,100.00</td>
<td>MCKNIGHT</td>
</tr>
<tr>
<td>25.00</td>
<td>$11,000.00</td>
<td>STEVENS</td>
</tr>
<tr>
<td></td>
<td>$13,200.00</td>
<td>SMITH</td>
</tr>
<tr>
<td></td>
<td>$26,862.00</td>
<td>IRVING</td>
</tr>
<tr>
<td></td>
<td>$9,000.00</td>
<td>GREENSPAN</td>
</tr>
<tr>
<td></td>
<td>$27,062.00</td>
<td>CROSS</td>
</tr>
<tr>
<td>Others</td>
<td>$78,800.00</td>
<td></td>
</tr>
</tbody>
</table>
If the BY HIGHEST phrase is changed to BY LOWEST, all values above the top grouping (50 ED_HRS and above) are included in the Others category:

TABLE FILE EMPLOYEE
PRINT CURR_SAL LAST_NAME
   BY LOWEST 2 ED_HRS
       PLUS OTHERS AS 'Others'
IN-GROUPS-OF 25 TOP 50
END

The output is:

<table>
<thead>
<tr>
<th>ED_HRS</th>
<th>CURR_SAL</th>
<th>LAST_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>------</td>
<td>--------</td>
<td>---------</td>
</tr>
<tr>
<td>.00</td>
<td>$9,500.00</td>
<td>SMITH</td>
</tr>
<tr>
<td>$29,700.00</td>
<td>BANNING</td>
<td></td>
</tr>
<tr>
<td>$21,120.00</td>
<td>ROMANS</td>
<td></td>
</tr>
<tr>
<td>$18,480.00</td>
<td>MCCOY</td>
<td></td>
</tr>
<tr>
<td>25.00</td>
<td>$11,000.00</td>
<td>STEVEN</td>
</tr>
<tr>
<td>$13,200.00</td>
<td>SMITH</td>
<td></td>
</tr>
<tr>
<td>$26,862.00</td>
<td>IRVING</td>
<td></td>
</tr>
<tr>
<td>$9,000.00</td>
<td>GREENSPAN</td>
<td></td>
</tr>
<tr>
<td>$27,062.00</td>
<td>CROSS</td>
<td></td>
</tr>
<tr>
<td>Others</td>
<td>$56,360.00</td>
<td></td>
</tr>
</tbody>
</table>

SET EMPTYREPORT=ANSI

How to:

Produce ANSI-Compliant Reports With No Records

Example:

Counting Fields With SET EMPTYREPORT=ANSI
Summing Fields With EMPTYREPORT=ANSI
Setting EMPTYREPORT=ON
Printing Fields and Setting EMPTYREPORT=ANSI in the Request

The EMPTYREPORT=ANSI setting introduces ANSI-compliant handling of reports with zero records, producing a one-line report containing only the specified missing data character. If the request is a COUNT operation, however, a zero is displayed for the missing values.
Syntax: **How to Produce ANSI-Compliant Reports With No Records**

```plaintext
SET EMPTYREPORT={ANSI | ON | OFF}
```

where:

**ANSI**

Produces a single-line report and displays the missing data character or a zero if a COUNT is requested. In each case, &RECORDS will be 0, and &LINES will be 1. If the SQL Translator is invoked, ANSI automatically replaces OFF as the default setting for EMPTYREPORT.

**ON**

Produces an empty report (column headings with no content). This was the default behavior in prior releases.

**OFF**

Produces no report output. OFF is the default value except for SQL Translator requests. When the SQL Translator is invoked, ANSI replaces OFF as the default setting for the EMPTYREPORT parameter, so the results are the same as for the ANSI setting.

The command can also be issued from within a request:

```plaintext
ON TABLE SET EMPTYREPORT ANSI
```

Example: **Counting Fields With SET EMPTYREPORT=ANSI**

```plaintext
SET EMPTYREPORT=ANSI
TABLE FILE EMPLOYEE
COUNT CURR_SAL AND DEPARTMENT
WHERE LAST_NAME EQ 'PATRICK'
END
```

The output shows no records and one line, with a zero displayed for CURR_SAL and a period for Department:

```
NUMBER OF RECORDS IN TABLE=        0  LINES=      1
PAUSE.. PLEASE ISSUE CARRIAGE RETURN WHEN READY

CURR_SAL      DEPARTMENT
COUNT         COUNT
-----------  -----------
0            0
```

Summary of New Features 65
Example: Summing Fields With EMPTYREPORT=ANSI

SET EMPTYREPORT=ANSI
TABLE FILE EMPLOYEE
SUM CURR_SAL
IF LAST_NAME EQ 'PATRICK'
END

Here is the output. Note that with SUM, the default missing data character (.) is displayed for CURR_SAL.

> NUMBER OF RECORDS IN TABLE= 0 LINES= 1
PAUSE.. PLEASE ISSUE CARRIAGE RETURN WHEN READY
CURR_SAL
--------
.

Example: Setting EMPTYREPORT=ON

SET EMPTYREPORT=ON
TABLE FILE EMPLOYEE
PRINT CURR_SAL AND DEPARTMENT
IF LAST_NAME EQ 'PATRICK'
END

With EMPTYREPORT=ON, there are no lines in the report.

> NUMBER OF RECORDS IN TABLE= 0 LINES= 0
PAUSE.. PLEASE ISSUE CARRIAGE RETURN WHEN READY
CURR_SAL DEPARTMENT
-------- --------
**Example:** Printing Fields and Setting EMPTYREPORT=ANSI in the Request

With PRINT you get one line, with the default missing data character (.) displayed.

```
TABLE FILE EMPLOYEE
PRINT CURR_SAL AND DEPARTMENT
IF DEPARTMENT EQ 'PATRICK'
ON TABLE SET EMPTYREPORT ANSI
END
```

The output is:

```
NUMBER OF RECORDS IN TABLE=        0  LINES=      1
PAUSE.. PLEASE ISSUE CARRIAGE RETURN WHEN READY

CURR_SAL  DEPARTMENT
--------  ----------
.  .
```

**Preserving Filter Definitions During Join Parsing**

**How to:**

Preserve Filter Definitions With KEEPFILTERS

**Example:**

Preserving Filters With KEEPFILTERS

By default, filters defined on the host data source are cleared by a JOIN command. However, filters can be maintained when a JOIN command is issued, by issuing the SET KEEPFILTERS=ON command.

Setting KEEPFILTERS to ON reinstates filter definitions and their individual declared status after a JOIN command. The set of filters and virtual fields defined prior to each join is called a context (see your documentation on SET KEEPDEFINES and on DEFINE FILE SAVE for information about contexts as they relate to virtual fields). Each new JOIN or DEFINE FILE command creates a new context.

If a new filter is defined after a JOIN command, it cannot have the same name as any previously defined filter unless you issue the FILTER FILE command with the CLEAR option. The CLEAR option clears all filter definitions for that data source in all contexts.

When a JOIN is cleared, each filter definition that was in effect prior to the JOIN command and that was not cleared, is reinstated with its original status. Clearing a join by issuing the JOIN CLEAR join_name command removes all of the contexts and filter definitions that were created after the JOIN join_name command was issued.
Syntax: **How to Preserve Filter Definitions With KEEPFILTERS**

```
SET KEEPFILTERS = {OFF | ON}
```

where:

- **OFF**
  - Does not preserve filters issued prior to a join. This is the default value.
- **ON**
  - Preserves filters across joins.

Example: **Preserving Filters With KEEPFILTERS**

The first filter, UNITPR, is defined prior to issuing any joins, but after setting KEEPFILTERS to ON:

```
SET KEEPFILTERS = ON
FILTER FILE VIDEOTRK
PERUNIT/F5 = TRANSTOT/QUANTITY;
NAME=UNITPR
WHERE PERUNIT GT 2
WHERE LASTNAME LE 'CRUZ'
END
```

The `? FILTER` command shows that the filter named UNITPR was created but not activated (activation is indicated by an asterisk in the SET column of the display):

```
? FILTER
```

```
<table>
<thead>
<tr>
<th>SET FILE</th>
<th>FILTER NAME</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>VIDEOTRK UNITPR</td>
<td></td>
</tr>
</tbody>
</table>
```

Next the filter is activated:

```
SET FILTER= UNITPR IN VIDEOTRK ON
```

The `? FILTER` query shows that the filter is now activated:

```
? FILTER
```

```
<table>
<thead>
<tr>
<th>SET FILE</th>
<th>FILTER NAME</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>VIDEOTRK UNITPR</td>
<td></td>
</tr>
</tbody>
</table>
```
The following TABLE request is issued against the filtered data source:

```
TABLE FILE VIDEOTRK
SUM QUANTITY TRANSTOT BY LASTNAME
END
```

The output shows that the TABLE request retrieved only the data that satisfies the UNITPR filter:

```
NUMBER OF RECORDS IN TABLE= 6  LINES= 3
ACCESS LIMITED BY FILTERS
```

```
PAUSE.. PLEASE ISSUE CARRIAGE RETURN WHEN READY
```

```
LASTNAME     QUANTITY  TRANSTOT
--------     --------  --------
CHANG        3           31.00
COLE         2           18.98
CRUZ         2           16.00
```

Now, the VIDEOTRK data source is joined to the MOVIES data source. The ? FILTER query shows that the join did not clear the UNITPR filter:

```
JOIN MOVIECODE IN VIDEOTRK TO ALL MOVIECODE IN MOVIES AS J1
```

The ? FILTER command shows that the UNITPR filter still exists and is still activated:

```
? FILTER
```

```
SET FILE     FILTER NAME DESCRIPTION
--- -------- ----------- ---------------------------------
*   VIDEOTRK UNITPR
```

Next a new filter, YEARS1, is created and activated for the join between VIDEOTRK and MOVIES:

```
FILTER FILE VIDEOTRK
YEARS/I5 = (EXPDATE - TRANSDATE)/365;
NAME=YEARS1
WHERE YEARS GT 1
END
```

```
SET FILTER= YEARS1 IN VIDEOTRK ON
```

The ? FILTER query shows that both the UNITPR and YEARS1 filters exist and are activated:

```
? FILTER
```

```
SET FILE     FILTER NAME DESCRIPTION
--- -------- ----------- ---------------------------------
*   VIDEOTRK UNITPR
*   VIDEOTRK YEARS1
```
Now, J1 is cleared. The output of the ? FILTER command shows that the YEARS1 filter that was created after the JOIN command was issued no longer exists. The UNITPR filter created prior to the JOIN command still exists with its original status:

JOIN CLEAR J1
? FILTER

SET FILE     FILTER NAME DESCRIPTION
--- -------- ----------- ---------------------------------
  * VIDEOTRK UNITPR

**SET SUMMARYLINES=EXPLICIT**

The SET SUMMARYLINES=EXPLICIT command makes the processing of SUBTOTAL, SUBTOTAL, SUMMARIZE, and RECOMPUTE on the grand total line consistent with how they work for sort field breaks.

When SUBTOTAL and RECOMPUTE are used at a sort break level, they do not propagate to other sort breaks. SUB-TOTAL and SUMMARIZE propagate to all higher level sort breaks.

The grand total can be considered the highest level sort field in a request. However, by default, all of the summary options, not just SUB-TOTAL and SUMMARIZE, propagate to the grand total level.

The SET SUMMARYLINES=EXPLICIT prevents the propagation of SUBTOTAL and RECOMPUTE to the grand total. In addition, if all summary commands in the request specify field lists, only the specified fields are aggregated and displayed on the grand total line.

When SUBTOTAL and RECOMPUTE are the only summary commands used in the request, a grand total line is produced only if it is explicitly specified in the request using the ON TABLE SUBTOTAL/SUB-TOTAL/RECOMPUTE/SUMMARIZE phrase. If the ON TABLE phrase specifies a field list, only those fields are aggregated and displayed.
Note that you can always suppress the grand total line using the ON TABLE NOTOTAL command in the request.

**Syntax:**

**How to Prevent Propagation of SUBTOTAL and RECOMPUTE to the Grand Total**

`SET SUMMARYLINES = {OLD|NEW|EXPLICIT}`

where:

**OLD**

Propagates all summary operations to the grand total line. Does not allow mixing of fields with and without prefix operators on a summary command when the first field does not have an associated prefix operator. All fields listed in any summary command are populated on all summary lines. OLD is the default value.

**NEW**

Propagates all summary operations to the grand total line. Uses prefix operator processing for all summary commands (all summary fields without prefix operators are processed as though they had a SUM. operator). Fields listed in a summary command are populated only on summary lines created by that summary command and on summary lines created by propagation of that summary command. Supports display of alphanumeric fields on summary lines.

**EXPLICIT**

Does not propagate SUBTOTAL and RECOMPUTE to the grand total line. Uses prefix operator processing for all summary commands (all summary fields without prefix operators are processed as though they had a SUM. operator). Fields listed in a summary command are populated only on summary lines created by that summary command and on summary lines created by propagation of that summary command. Supports display of alphanumeric fields on summary lines.

**Note:** This command is not supported in a request using the ON TABLE SET syntax.

**Reference: Usage Notes for SET SUMMARYLINES=EXPLICIT**

If COLUMN-TOTAL is specified in the request, all numeric fields are totaled on the grand total line unless the COLUMN-TOTAL phrase lists specific fields. If the COLUMN-TOTAL phrase lists specific fields, those fields and any fields propagated by SUB-TOTAL or SUMMARIZE commands are totaled.
Example: Using SET SUMMARYLINES With SUBTOTAL

The following request using the MOVIES data source has a sort break for CATEGORY that subtotals the COPIES field and a sort break for RATING that subtotals the LISTPR field:

```
SET SUMMARYLINES=OLD
TABLE FILE MOVIES
SUM COPIES LISTPR WHOLESALEPR
BY RATING
BY CATEGORY
WHERE CATEGORY EQ 'CHILDREN'
WHERE RATING EQ 'G'
ON RATING SUBTOTAL COPIES
ON CATEGORY SUBTOTAL LISTPR
END
```

Running the request with SUMMARYLINES=OLD subtotals both COPIES and LISTPR at every sort break and propagates them to the grand total line:

```
RATING    CATEGORY    COPIES  LISTPR  WHOLESALEPR
-------    --------    ------  ------  -----------
G          CHILDREN    7     101.89        54.49

*TOTAL CHILDREN        7     101.89
*TOTAL G               7

TOTAL                  7     101.89
```

Running the request with SUMMARYLINES=NEW subtotals COPIES only for the RATING sort break and subtotals LISTPR only for the CATEGORY sort break but propagates both to the grand total line:

```
RATING    CATEGORY    COPIES  LISTPR  WHOLESALEPR
-------    --------    ------  ------  -----------
G          CHILDREN    7     101.89        54.49

*TOTAL CHILDREN    101.89
*TOTAL G           7

TOTAL                  7     101.89
```
Running the request with SUMMARYLINES=EXPLICIT subtotals COPIES only for the RATING sort break and subtotals LISTPR only for the CATEGORY sort break. It does not produce a grand total line:

<table>
<thead>
<tr>
<th>RATING</th>
<th>CATEGORY</th>
<th>COPIES</th>
<th>LISTPR</th>
<th>WHOLESALEPR</th>
</tr>
</thead>
<tbody>
<tr>
<td>G</td>
<td>CHILDREN</td>
<td>7</td>
<td>101.89</td>
<td>54.49</td>
</tr>
</tbody>
</table>

*TOTAL CHILDREN 101.89
*TOTAL G 7

Adding the phrase ON TABLE SUBTOTAL WHOLESALEPR with SUMMARYLINES=EXPLICIT produces a grand total line with the WHOLESALEPR field subtotaled:

<table>
<thead>
<tr>
<th>RATING</th>
<th>CATEGORY</th>
<th>COPIES</th>
<th>LISTPR</th>
<th>WHOLESALEPR</th>
</tr>
</thead>
<tbody>
<tr>
<td>G</td>
<td>CHILDREN</td>
<td>7</td>
<td>101.89</td>
<td>54.49</td>
</tr>
</tbody>
</table>

*TOTAL CHILDREN 101.89
*TOTAL G 7

TOTAL 54.49
Example: Using COLUMN-TOTAL With SET SUMMARYLINES=EXPLICIT

The following request using the MOVIES data source has a sort break for CATEGORY for which subtotals the COPIES field and a sort break for RATING that subtotals the LISTPR field. It also has an ON TABLE COLUMN-TOTAL phrase:

```
SET SUMMARYLINES=EXPLICIT
TABLE FILE MOVIES
SUM COPIES LISTPR WHOLESALEPR
BY RATING
BY CATEGORY
WHERE CATEGORY EQ 'CHILDREN'
WHERE RATING EQ 'G'
ON RATING SUBTOTAL COPIES
ON CATEGORY SUBTOTAL LISTPR
ON TABLE COLUMN-TOTAL
END
```

The grand total line displays a column total for all numeric columns because of the ON TABLE COLUMN-TOTAL phrase:

```
RATING   CATEGORY  COPIES  LISTPR  WHOLESALEPR
------  --------  ------  ------  -----------
G       CHILDREN       7  101.89        54.49

*TOTAL CHILDREN           101.89
*TOTAL G               7

TOTAL                  7  101.89        54.49
```
The following request has an ON TABLE SUBTOTAL WHOLESALEPR command. It also has an ON TABLE COLUMN-TOTAL phrase:

```
SET SUMMARYLINES=EXPLICIT
TABLE FILE MOVIES
SUM COPIES LISTPR WHOLESALEPR
BY RATING
BY CATEGORY
WHERE CATEGORY EQ 'CHILDREN'
WHERE RATING EQ 'G'
ON RATING SUBTOTAL COPIES
ON CATEGORY SUBTOTAL LISTPR
ON TABLE SUBTOTAL WHOLESALEPR
ON TABLE COLUMN-TOTAL
END
```

The grand total line displays a column total only for the WHOLESALEPR column because of the ON TABLE SUBTOTAL command:

```
<table>
<thead>
<tr>
<th>RATING</th>
<th>CATEGORY</th>
<th>COPIES</th>
<th>LISTPR</th>
<th>WHOLESALEPR</th>
</tr>
</thead>
<tbody>
<tr>
<td>G</td>
<td>CHILDREN</td>
<td>7</td>
<td>101.89</td>
<td>54.49</td>
</tr>
<tr>
<td>*TOTAL</td>
<td>CHILDREN</td>
<td></td>
<td>101.89</td>
<td></td>
</tr>
<tr>
<td>*TOTAL</td>
<td>G</td>
<td></td>
<td>7</td>
<td></td>
</tr>
<tr>
<td>TOTAL</td>
<td></td>
<td></td>
<td></td>
<td>54.49</td>
</tr>
</tbody>
</table>
```
Using SUB-TOTAL instead of SUBTOTAL causes COPIES and LISTPR to be aggregated on the grand total line. WHOLESALEPR is totaled because it is listed in the COLUMN-TOTAL phrase. The subtotal for LISTPR propagates to the RATING sort break as well as to the grand total:

```
SET SUMMARYLINES=EXPLICIT
TABLE FILE MOVIES
SUM COPIES LISTPR WHOLESALEPR
BY RATING
BY CATEGORY
WHERE CATEGORY EQ 'CHILDREN'
WHERE RATING   EQ 'G'
ON RATING SUB-TOTAL COPIES
ON CATEGORY SUB-TOTAL LISTPR
ON TABLE COLUMN-TOTAL WHOLESALEPR
END
```

The output is:

```
RATING  CATEGORY  COPIES  LISTPR  WHOLESALEPR
------  --------  ------  ------  -----------
G       CHILDREN       7  101.89        54.49

*TOTAL CHILDREN           101.89
*TOTAL G               7  101.89

TOTAL                  7  101.89        54.49
```
ON TABLE SET BYPANEL

The SET BYPANEL command, which controls whether vertical sort (BY) fields are repeated on each panel of a report, is now supported in a TABLE request.

Syntax:  How to Control Repetition of BY Fields on Report Panels in a Request

ON TABLE SET BYPANEL = option
END

where:

option

Is one of the following:

ON displays all BY fields specified in the report request on each panel, and prevents column splitting.

OFF displays BY fields on the first panel only. Column splitting is permitted. OFF is the default value.

0 displays BY fields only on the first panel. This prevents column splitting.

n is the number of BY fields to be displayed; n is less than or equal to the total number of BY fields specified in the request, from the major sort (first BY field) down. This prevents column splitting.

Column splitting occurs when a report column is too large to fit on the defined panel. By default, the column is split, displaying as many characters as possible, and the remaining characters continue on the next panel.
When you join two data sources, some records in one of the files may lack corresponding records in the other file. When a report omits records that are not in both files, the join is called an inner join. When a report displays all matching records, plus all records from the host file that lack corresponding cross-referenced records, the join is called a left outer join.

The SET ALL command globally determines how all joins are implemented. If the SET ALL=ON command is issued, all joins are treated as outer joins. With SET ALL=OFF, the default, all joins are treated as inner joins.

Each JOIN command can specify explicitly which type of join to perform, locally overruling the global setting. This syntax is supported for FOCUS, XFOCUS, Relational, VSAM, IMS, and Adabas. If you do not specify the type of join in the JOIN command, the ALL parameter setting determines the type of join to perform.
Reference: Relational Data Adapters and Optimization of LEFT OUTER/INNER JOINs

The relational data adapters can optimize (translate to a single SQL SELECT statement processed by the relational engine) outer joins and combinations of joins under the following conditions:

- The OPTIMIZATION setting must not be OFF.
- The data adapter setting SQLJOIN OUTER must be set to ON. ON is the default value for all relational adapters except DB2.
- The data sources that participate in the JOIN must be for the same relational engine on the same server. For DB2, they must reside in the same subsystem.
- For conditional joins, the join expressions must be optimizable.
- If the tables do not share a single retrieval path in the joined structure, the setting SET MULTIPATH=COMPOUND must be in effect. Without this setting, multiple path joins are not optimized.

A left outer join in the root path (path leading to the root segment) of an inner join is converted to an inner join and the following message is generated:

(FOC32456) ANSI-COMPLIANCE ENFORCED BY CHANGING OUTER JOIN TO INNER

A left outer join in the root-path of an inner join has been changed into an inner join.

Aggregation commands such as SUM or COUNT cause the RDBMS to duplicate data. This prevents the join from being optimized. However, in some cases the data adapter can eliminate duplicate rows before passing the data back to FOCUS. It does this by adding an ORDER BY clause on all primary key columns to the SELECT statement it passes to the RDBMS for each table so that it can compare the returned data from all of the tables. This is called data adapter managed native join optimization.

In order to invoke this type of optimization, primary keys must exist (KEYS>0 in the Access File) for all segments except for the lowest level segment referenced in a report request that includes:

- Aggregation operators such as SUM or COUNT, when the OPTIMIZATION setting is ON or FOCUS.
- Multiple FST. or LST. operators on a segment that could return more than one record per sort break, regardless of the OPTIMIZATION setting.

In these situations, data adapter native join optimization is invoked regardless of the MULTIPATH setting.
### Syntax: How to Specify an Inner or Left Outer Equijoin Between Real Fields

JOIN [LEFT_OUTER|INNER] hfld1 [AND hfld2 ...] IN hostfile [TAG tag1] 
TO [UNIQUE|MULTIPLE|ALL] crfield 
[AND crfld2 ...] IN crfile [TAG tag2] [AS joinname]
END

**where:**

**LEFT OUTER**

Specifies a left outer join. If you do not specify the type of join in the JOIN command, the ALL parameter setting determines the type of join to perform.

**INNER**

Specifies an inner join. If you do not specify the type of join in the JOIN command, the ALL parameter setting determines the type of join to perform.

**hfld1**

Is the name of a field in the host file containing values shared with a field in the cross-referenced file. This field is called the host field.

**hfld2...**

Can be an additional field in the host file, with the caveats noted below. The phrase beginning with AND is required when specifying multiple fields.

- When you are joining two FOCUS data sources you can specify up to four alphanumeric fields in the host file that, if concatenated, contain values shared with the cross-referenced file. You may not specify more than one field in the cross-referenced file when the suffix of the file is FOC. For example, assume the cross-referenced file contains a phone number field with an area code-prefix-exchange format. The host file has an area code field, a prefix field, and an exchange field. You can specify these three fields to join them to the phone number field in the cross-referenced file. The JOIN command treats the three fields as one. Other data sources do not have this restriction on the cross-referenced file.

- For data adapters that support multi-field and concatenated joins, you can specify up to 16 fields. See your data adapter documentation for specific information about supported join features. Note that FOCUS data sources do not support these joins.

**hostfile**

Is the name of the host file.
tag1
Is a tag name of up to eight characters (usually the name of the Master File), which is used as a unique qualifier for fields and aliases in the host file.
The tag name for the host file must be the same in all the JOIN commands of a joined structure.

TO [UNIQUE|MULTIPLE|ALL] crfld1
Is the name of a field in the cross-referenced file containing values that match those of hfld1 (or of concatenated host fields). This field is called the cross-referenced field.
Note: UNIQUE returns only one instance and, if there is no matching instance in the cross-referenced file, it supplies default values (blank for alphanumeric fields and zero for numeric fields).
Use the MULTIPLE parameter when crfld1 may have multiple instances in common with one value in hfld1. Note that ALL is a synonym for MULTIPLE, and omitting this parameter entirely is a synonym for UNIQUE.

crfld2...
Is the name of a field in the cross-referenced file with values in common with hfld2.
Note: crfld2 may be qualified. This field is only available for data adapters that support multi-field joins.

crfile
Is the name of the cross-referenced file.

tag2
Is a tag name of up to eight characters (usually the name of the Master File), which is used as a unique qualifier for fields and aliases in cross-referenced files. In a recursive join structure, if no tag name is provided, all field names and aliases are prefixed with the first four characters of the join name.
The tag name for the host file must be the same in all the JOIN commands of a joined structure.

joinname
Is an optional name of up to eight characters that you may assign to the join structure. You must assign a unique name to a join structure if:

☑ You want to ensure that a subsequent JOIN command does not overwrite it.
☑ You want to clear it selectively later.
☑ The structure is recursive.
Note: If you do not assign a name to the join structure with the AS phrase, the name is assumed to be blank. A join without a name overwrites an existing join without a name.

END
Required when the JOIN command is longer than one line; it terminates the command.
For information about required conditions for cross-referenced fields and restrictions on group fields, see the *Creating Reports* manual.

**Syntax:**  
**How to Specify an Inner or Left Outer DEFINE-based Equijoin**

```
JOIN [LEFT_OUTER|INNER] deffld WITH host_field ...
   IN hostfile [TAG tag1]
   TO [UNIQUE|MULTIPLE|ALL] cr_field
   IN crfile [TAG tag2] [AS joinname]
END
```

**where:**

- **LEFT OUTER**
  - Specifies a left outer join. If you do not specify the type of join in the JOIN command, the ALL parameter setting determines the type of join to perform.

- **INNER**
  - Specifies an inner join. If you do not specify the type of join in the JOIN command, the ALL parameter setting determines the type of join to perform.

- **deffld**
  - Is the name of a virtual field for the host file (the host field). The virtual field can be defined in the Master File or with a DEFINE command.

- **host_field**
  - Is the name of any real field in the host segment with which you want to associate the virtual field. This association is required to locate the virtual field.

  The WITH phrase is required unless the KEEPDEFINES parameter is set to ON and deffld was defined prior to issuing the JOIN command.

  To determine which segment contains the virtual field, use the ? DEFINE query after issuing the DEFINE command.

- **hostfile**
  - Is the name of the host file.

- **tag1**
  - Is a tag name of up to eight characters (usually the name of the Master File), which is used as a unique qualifier for fields and aliases in host files.

  The tag name for the host file must be the same in all the JOIN commands of a joined structure.
TO [UNIQUE|MULTIPLE|ALL] crfld1

Is the name of a real field in the cross-referenced data source whose values match those of the virtual field. This must be a real field declared in the Master File.

**Note:** UNIQUE returns only one instance and, if there is no matching instance in the cross-referenced file, it supplies default values (blank for alphanumeric fields and zero for numeric fields).

Use the MULTIPLE parameter when crfld1 may have multiple instances in common with one value in hfld1. Note that ALL is a synonym for MULTIPLE, and omitting this parameter entirely is a synonym for UNIQUE.

crfile

Is the name of the cross-referenced file.

tag2

Is a tag name of up to eight characters (usually the name of the Master File), which is used as a unique qualifier for fields and aliases in cross-referenced files. In a recursive joined structure, if no tag name is provided, all field names and aliases are prefixed with the first four characters of the join name.

The tag name for the host file must be the same in all the JOIN commands of a joined structure.

joinname

Is an optional name of up to eight characters that you may assign to the joined structure. You must assign a unique name to a join structure if:

- You want to ensure that a subsequent JOIN command does not overwrite it.
- You want to clear it selectively later.
- The structure is recursive, and you do not specify tag names.

If you do not assign a name to the joined structure with the AS phrase, the name is assumed to be blank. A join without a name overwrites an existing join without a name.

END

Required when the JOIN command is longer than one line; terminates the command.

For information about required conditions for cross-referenced fields and restrictions on group fields, see the *Creating Reports* manual.
**Syntax:** How to Specify an Inner or Left Outer Conditional JOIN

```
JOIN [LEFT_OUTER|INNER] FILE hostfile AT hfld1 [TAG tag1]
    [WITH hfld2]
    TO {UNIQUE|MULTIPLE|ALL}
    FILE crfile AT crfld [TAG tag2] [AS joinname]
    [WHERE expression1;]
    [WHERE expression2;]
    ...
END
```

where:

**LEFT OUTER**

Specifies a left outer join. If you do not specify the type of join in the JOIN command, the ALL parameter setting determines the type of join to perform.

**INNER**

Specifies an inner join. If you do not specify the type of join in the JOIN command, the ALL parameter setting determines the type of join to perform.

**hostfile**

Is the host Master File.

**AT**

Links the correct parent segment or host to the correct child or cross-referenced segment. The field values used as the AT parameter are not used to cause the link. They are simply used as segment references.

**hfld1**

Is the field name in the host Master File whose segment will be joined to the cross-referenced data source. The field name must be at the lowest level segment in its data source that is referenced.

**tag1**

Is the optional tag name that is used as a unique qualifier for fields and aliases in the host data source.

**hfld2**

Is a data source field with which to associate a DEFINE-based conditional JOIN. For a DEFINE-based conditional join, the KEEPDEFINES setting must be ON, and you must create the virtual fields before issuing the JOIN command.
UNIQUE
   Specifies a one-to-one relationship between from_file and to_file. Note that ONE is a synonym for UNIQUE.

   **Note:** Unique returns only one instance and, if there is no matching instance in the cross-referenced file, it supplies default values (blank for alphanumerical fields and zero for numeric fields).

MULTIPLE|ALL
   Specifies a one-to-many relationship between from_file and to_file. Note that ALL is a synonym for MULTIPLE.

crfile
   Is the cross-referenced Master File.

crflid
   Is the join field name in the cross-referenced Master File. It can be any field in the segment.

tag2
   Is the optional tag name that is used as a unique qualifier for fields and aliases in the cross-referenced data source.

joinname
   Is the name associated with the joined structure.

expression1, expression2
   Are any expressions that are acceptable in a DEFINE FILE command. All fields used in the expressions must lie on a single path.

   **Note:** Single line JOIN syntax is not supported. The END command is required.
Reference: Usage Notes for Inner and Outer JOIN Command Syntax

- The SET ALL and SET CARTESIAN commands are ignored by the syntax.
- The ALL. parameter is not supported. If the ALL. parameter is used, the following message displays:

  (FOC32452) Use of ALL. with LEFT_OUTER/INNER not allowed

- If you define multiple joins, the resulting structure can be a single path or multi-path data source:
  - If the setting MULTIPATH=SIMPLE is in effect and the report is based on multiple paths, each of the individual joins is constructed separately without regard to the other joins, and the matching records from each of the separate paths displays on the report output. Therefore, the output can contain records that would have been omitted if only one of the joins was in effect.
  - If the setting MULTIPATH=COMPOUND is in effect with a multi-path report, or if the report displays data only from a single path, the report output displays only those records that satisfy all of the joins.

Procedure: How to Create Data Sources Used in Inner and Left Outer Join Examples

The following procedure creates three FOCUS data sources:

- EMPINFO, which contains the fields EMP_ID, LAST_NAME, FIRST_NAME, and CURR_JOBCODE from the EMPINFO segment of the EMPLOYEE data source.
- JOBINFO, which contains the JOBCODE and JOB_DESC fields from the JOBFILE data source.
- EDINFO, which contains the EMP_ID, COURSE_CODE, and COURSE_NAME fields from the EDUCFILE data source.
The procedure then adds an employee to EMPINFO named Fred Newman who has no matching record in the JOBINFO or EDINFO data sources.

```
TABLE FILE EMPLOYEE
SUM LAST_NAME FIRST_NAME CURR_JOBCODE
BY EMP_ID
ON TABLE HOLD AS EMPINFO FORMAT FOCUS INDEX EMP_ID CURR_JOBCODE
END
-RUN

TABLE FILE JOBFILE
SUM JOB_DESC
BY JOBCODE
ON TABLE HOLD AS JOBINFO FORMAT FOCUS INDEX JOBCODE
END
-RUN

TABLE FILE EDUCFILE
SUM COURSE_CODE COURSE_NAME
BY EMP_ID
ON TABLE HOLD AS EDINFO FORMAT FOCUS INDEX EMP_ID
END
-RUN

MODIFY FILE EMPINFO
FREEFORM EMP_ID LAST_NAME FIRST_NAME CURR_JOBCODE
MATCH EMP_ID
ON NOMATCH INCLUDE
ON MATCH REJECT
DATA
111111111, NEWMAN, FRED, C07,$
END
```
The following request prints the contents of EMPINFO. Note that Fred Newman has been added to the data source:

```
TABLE FILE EMPINFO
PRINT *
END
```

The output is:

<table>
<thead>
<tr>
<th>EMP_ID</th>
<th>LAST_NAME</th>
<th>FIRST_NAME</th>
<th>CURR_JOBCODE</th>
</tr>
</thead>
<tbody>
<tr>
<td>071382660</td>
<td>STEVENS</td>
<td>ALFRED</td>
<td>A07</td>
</tr>
<tr>
<td>112847612</td>
<td>SMITH</td>
<td>MARY</td>
<td>B14</td>
</tr>
<tr>
<td>117593129</td>
<td>JONES</td>
<td>DIANE</td>
<td>B03</td>
</tr>
<tr>
<td>119265415</td>
<td>SMITH</td>
<td>RICHARD</td>
<td>A01</td>
</tr>
<tr>
<td>119329144</td>
<td>BANNING</td>
<td>JOHN</td>
<td>A17</td>
</tr>
<tr>
<td>123764317</td>
<td>IRVING</td>
<td>JOAN</td>
<td>A15</td>
</tr>
<tr>
<td>126724188</td>
<td>ROMANS</td>
<td>ANTHONY</td>
<td>B04</td>
</tr>
<tr>
<td>219984371</td>
<td>MCCOY</td>
<td>JOHN</td>
<td>B02</td>
</tr>
<tr>
<td>326179357</td>
<td>BLACKWOOD</td>
<td>ROSEMARIE</td>
<td>B04</td>
</tr>
<tr>
<td>451123478</td>
<td>MCKNIGHT</td>
<td>ROGER</td>
<td>B02</td>
</tr>
<tr>
<td>543729165</td>
<td>GREENSPAN</td>
<td>MARY</td>
<td>A07</td>
</tr>
<tr>
<td>818692173</td>
<td>CROSS</td>
<td>BARBARA</td>
<td>A17</td>
</tr>
<tr>
<td>111111111</td>
<td>NEWMAN</td>
<td>FRED</td>
<td>C07</td>
</tr>
</tbody>
</table>
Example: Creating an Inner Join

The following JOIN command creates an inner join between the EMPINFO data source and the JOBINFO data source.

```
JOIN CLEAR *
JOIN INNER CURR_JOBCODE IN EMPINFO TO MULTIPLE JOBCODE IN JOBINFO AS J0
```

Note that the JOIN command specifies a multiple join. In a unique join, the cross-referenced segment is never considered missing, and all records from the host file display on the report output. Default values (blank for alphanumeric fields and zero for numeric fields) display if no actual data exists.

The following request displays fields from the joined structure:

```
TABLE FILE EMPINFO
PRINT LAST_NAME FIRST_NAME JOB_DESC
END
```

Fred Newman is omitted from the report output because his job code does not have a match in the JOBINFO data source:

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>FIRST_NAME</th>
<th>JOB_DESC</th>
</tr>
</thead>
<tbody>
<tr>
<td>STEVENS</td>
<td>ALFRED</td>
<td>SECRETARY</td>
</tr>
<tr>
<td>SMITH</td>
<td>MARY</td>
<td>FILE QUALITY</td>
</tr>
<tr>
<td>JONES</td>
<td>DIANE</td>
<td>PROGRAMMER ANALYST</td>
</tr>
<tr>
<td>SMITH</td>
<td>RICHARD</td>
<td>PRODUCTION CLERK</td>
</tr>
<tr>
<td>BANNING</td>
<td>JOHN</td>
<td>DEPARTMENT MANAGER</td>
</tr>
<tr>
<td>IRVING</td>
<td>JOAN</td>
<td>ASSIST.MANAGER</td>
</tr>
<tr>
<td>ROMANS</td>
<td>ANTHONY</td>
<td>SYSTEMS ANALYST</td>
</tr>
<tr>
<td>MCCOY</td>
<td>JOHN</td>
<td>PROGRAMMER</td>
</tr>
<tr>
<td>BLACKWOOD</td>
<td>ROSEMARIE</td>
<td>SYSTEMS ANALYST</td>
</tr>
<tr>
<td>MCKNIGHT</td>
<td>ROGER</td>
<td>PROGRAMMER</td>
</tr>
<tr>
<td>GREENSPAN</td>
<td>MARY</td>
<td>SECRETARY</td>
</tr>
<tr>
<td>CROSS</td>
<td>BARBARA</td>
<td>DEPARTMENT MANAGER</td>
</tr>
</tbody>
</table>
Example: Creating a Left Outer Join

The following JOIN command creates a left outer join between the EMPINFO data source and the EDINFO data source:

```
JOIN CLEAR *
JOIN LEFT_OUTER EMP_ID IN EMPINFO TO MULTIPLE EMP_ID IN EDINFO AS J1
```

The following request displays fields from the joined structure:

```
TABLE FILE EMPINFO
PRINT LAST_NAME FIRST_NAME COURSE_NAME
END
```

All employee records display on the report output. The records for those employees with no matching records in the EDINFO data source display the missing data character (.) in the COURSE_NAME column. If the join were unique, blanks would display instead of the missing data character.

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>FIRST_NAME</th>
<th>COURSE_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>STEVENS</td>
<td>ALFRED</td>
<td>FILE DESCRPT &amp; MAINT</td>
</tr>
<tr>
<td>SMITH</td>
<td>MARY</td>
<td>BASIC REPORT PREP FOR PROG</td>
</tr>
<tr>
<td>JONES</td>
<td>DIANE</td>
<td>FOCUS INTERNALS</td>
</tr>
<tr>
<td>SMITH</td>
<td>RICHARD</td>
<td>BASIC RPT NON-DP MGRS</td>
</tr>
<tr>
<td>BANNING</td>
<td>JOHN</td>
<td></td>
</tr>
<tr>
<td>IRVING</td>
<td>JOAN</td>
<td></td>
</tr>
<tr>
<td>ROMANS</td>
<td>ANTHONY</td>
<td></td>
</tr>
<tr>
<td>MCCOY</td>
<td>JOHN</td>
<td></td>
</tr>
<tr>
<td>BLACKWOOD</td>
<td>ROSEMARIE</td>
<td>DECISION SUPPORT WORKSHOP</td>
</tr>
<tr>
<td>MCKNIGHT</td>
<td>ROGER</td>
<td>FILE DESCRPT &amp; MAINT</td>
</tr>
<tr>
<td>GREENSPAN</td>
<td>MARY</td>
<td></td>
</tr>
<tr>
<td>CROSS</td>
<td>BARBARA</td>
<td>HOST LANGUAGE INTERFACE</td>
</tr>
<tr>
<td>NEWMAN</td>
<td>FRED</td>
<td></td>
</tr>
</tbody>
</table>
Example:  **Creating Two Inner Joins With a Multipath Structure**

The following JOIN commands create an inner join between the EMPINFO and JOBINFO data sources and an inner join between the EMPINFO and EDINFO data sources:

```
JOIN CLEAR *
JOIN INNER CURR_JOBCODE IN EMPINFO TO MULTIPLE JOBCODE IN JOBINFO AS J0
JOIN INNER EMP_ID IN EMPINFO TO MULTIPLE EMP_ID IN EDINFO AS J1
```

The structure created by the two joins has two independent paths:

```
SEG01
  01 S1
  *************
  *EMP_ID     **I
  *CURR_JOBCODE**I
  *LAST_NAME   **
  *FIRST_NAME  **
  *
  *************
  *************
  ****************
    
    +-----------------+
    I                 I
    I SEG01           I SEG01
    02    I KM        03    I KM

:EMP_ID   ::K :JOBCODE ::K
:COURSE_CODE :: :JOB_DESC ::
:COURSE_NAME :: :   :
:       ::   :
:       ::   :
:...........::   :............:
:.............:    .............:
JOINED  EDINFO JOINED  JOBINFO
```
The following request displays fields from the joined structure:

```
SET MULTIPATH=SIMPLE
TABLE FILE EMPINFO
PRINT LAST_NAME FIRST_NAME IN 12 COURSE_NAME JOB_DESC
END
```

With MULTIPATH=SIMPLE, the independent paths create independent joins. All employee records accepted by either join display on the report output. Only Fred Newman (who has no matching record in either of the cross-referenced files) is omitted:

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>FIRST_NAME</th>
<th>COURSE_NAME</th>
<th>JOB_DESC</th>
</tr>
</thead>
<tbody>
<tr>
<td>STEVENS</td>
<td>ALFRED</td>
<td>FILE DESCRPT &amp; MAINT</td>
<td>SECRETARY</td>
</tr>
<tr>
<td>SMITH</td>
<td>MARY</td>
<td>BASIC REPORT PREP FOR PROG</td>
<td>FILE QUALITY</td>
</tr>
<tr>
<td>JONES</td>
<td>DIANE</td>
<td>FOCUS INTERNALS</td>
<td>PROGRAMMER ANALYST</td>
</tr>
<tr>
<td>SMITH</td>
<td>RICHARD</td>
<td>BASIC RPT NON-DP MGRS</td>
<td>PRODUCTION CLERK</td>
</tr>
<tr>
<td>BANNING</td>
<td>JOHN</td>
<td></td>
<td></td>
</tr>
<tr>
<td>IRVING</td>
<td>JOAN</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ROMANS</td>
<td>ANTHONY</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MCCOY</td>
<td>JOHN</td>
<td></td>
<td></td>
</tr>
<tr>
<td>BLACKWOOD</td>
<td>ROSEMARIE</td>
<td>DECISION SUPPORT WORKSHOP</td>
<td>SYSTEMS ANALYST</td>
</tr>
<tr>
<td>MCKNIGHT</td>
<td>ROGER</td>
<td>FILE DESCRPT &amp; MAINT</td>
<td>PROGRAMMER</td>
</tr>
<tr>
<td>GREENSPAN</td>
<td>MARY</td>
<td></td>
<td>SECRETARY</td>
</tr>
<tr>
<td>CROSS</td>
<td>BARBARA</td>
<td>HOST LANGUAGE INTERFACE</td>
<td></td>
</tr>
</tbody>
</table>

With MULTIPATH=COMPOUND, only employees with matching records in both of the cross-referenced files display on the report output:

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>FIRST_NAME</th>
<th>COURSE_NAME</th>
<th>JOB_DESC</th>
</tr>
</thead>
<tbody>
<tr>
<td>STEVENS</td>
<td>ALFRED</td>
<td>FILE DESCRPT &amp; MAINT</td>
<td>SECRETARY</td>
</tr>
<tr>
<td>SMITH</td>
<td>MARY</td>
<td>BASIC REPORT PREP FOR PROG</td>
<td>FILE QUALITY</td>
</tr>
<tr>
<td>JONES</td>
<td>DIANE</td>
<td>FOCUS INTERNALS</td>
<td>PROGRAMMER ANALYST</td>
</tr>
<tr>
<td>SMITH</td>
<td>RICHARD</td>
<td>BASIC RPT NON-DP MGRS</td>
<td>PRODUCTION CLERK</td>
</tr>
<tr>
<td>BLACKWOOD</td>
<td>ROSEMARIE</td>
<td>DECISION SUPPORT WORKSHOP</td>
<td>SYSTEMS ANALYST</td>
</tr>
<tr>
<td>MCKNIGHT</td>
<td>ROGER</td>
<td>FILE DESCRPT &amp; MAINT</td>
<td>PROGRAMMER</td>
</tr>
<tr>
<td>CROSS</td>
<td>BARBARA</td>
<td>HOST LANGUAGE INTERFACE</td>
<td></td>
</tr>
</tbody>
</table>

92 Information Builders
Example: Creating DB2 Data Sources Used in Join Examples

The following procedure creates DB2 data sources to use in join examples. This assumes the Master Files and Access Files for EMPINFO, JOBINFO, and EDINFO already exist and that you have the authority to create tables:

```sql
TABLE FILE EMPLOYEE
SUM LAST_NAME FIRST_NAME CURR_JOBCODE
BY EMP_ID
ON TABLE HOLD AS EMPF FORMAT FOCUS
END
-RUN

TABLE FILE JOBFILE
SUM JOB_DESC
BY JOBCODE
ON TABLE HOLD AS JOB1 FORMAT ALPHA
END
-RUN

TABLE FILE EDUCFILE
SUM COURSE_CODE COURSE_NAME
BY EMP_ID
ON TABLE HOLD AS ED1 FORMAT ALPHA
END
-RUN

-*Create new record with no match in job or ed files
MODIFY FILE EMPF
FREEFORM EMP_ID LAST_NAME FIRST_NAME CURR_JOBCODE
MATCH EMP_ID
  ON NOMATCH INCLUDE
  ON MATCH REJECT
DATA
111111111, NEWMAN, FRED, C07,$
END
-RUN

TABLE FILE EMPF
PRINT *
ON TABLE HOLD AS EMP1 FORMAT ALPHA
END
-RUN

-*Create DB2 tables
CREATE FILE EMPINFO
-RUN
CREATE FILE JOBINFO
-RUN
```
Example: Optimizing an Outer Join Between DB2 Data Sources

The following request joins the EMPINFO table to the JOBINFO table. The SET SQLJOIN OUTER ON command is required for DB2, which has OFF as its default value:

```sql
ENGINE DB2 SET SQLJOIN OUTER ON
SET TRACEUSER=ON
SET TRACETO=ALL
SET TRACEON = STMTRACE // CLIENT
-RUN

JOIN CLEAR *
-RUN
JOIN
_LEFT_OUTER CURR_JOBCODE IN EMPINFO TO MULTIPLE JOBCODE IN JOBINFO AS J0
END

TABLE FILE EMPINFO
PRINT LAST_NAME FIRST_NAME IN 12 JOB_DESC
END

The single SQL SELECT statement for both tables shows that the join is optimized:

```sql
SELECT T1."LN", T1."FN", T1."CJC", T2."JCD", T2."JDS" FROM
(USERID1."EMPINFO" T1 LEFT OUTER JOIN USERID1."JOBINFO" T2 ON T2."JCD" = T1."CJC") FOR FETCH ONLY;
```
Fred Newman is included although he has no matching record in the JOBINFO data source. His missing job description is indicated by the NODATA character (.):

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>FIRST_NAME</th>
<th>JOB_DESC</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMITH</td>
<td>RICHARD</td>
<td>PRODUCTION CLERK</td>
</tr>
<tr>
<td>GREENSPAN</td>
<td>MARY</td>
<td>SECRETARY</td>
</tr>
<tr>
<td>STEVENS</td>
<td>ALFRED</td>
<td>SECRETARY</td>
</tr>
<tr>
<td>IRVING</td>
<td>JOAN</td>
<td>ASSIST.MANAGER</td>
</tr>
<tr>
<td>BANNING</td>
<td>JOHN</td>
<td>DEPARTMENT MANAGER</td>
</tr>
<tr>
<td>CROSS</td>
<td>BARBARA</td>
<td>DEPARTMENT MANAGER</td>
</tr>
<tr>
<td>MCKNIGHT</td>
<td>ROGER</td>
<td>PROGRAMMER</td>
</tr>
<tr>
<td>MCCOY</td>
<td>JOHN</td>
<td>PROGRAMMER</td>
</tr>
<tr>
<td>JONES</td>
<td>DIANE</td>
<td>PROGRAMMER ANALYST</td>
</tr>
<tr>
<td>BLACKWOOD</td>
<td>ROSEMARIE</td>
<td>SYSTEMS ANALYST</td>
</tr>
<tr>
<td>ROMANS</td>
<td>ANTHONY</td>
<td>SYSTEMS ANALYST</td>
</tr>
<tr>
<td>SMITH</td>
<td>MARY</td>
<td>FILE QUALITY</td>
</tr>
<tr>
<td>NEWMAN</td>
<td>FRED</td>
<td>.</td>
</tr>
</tbody>
</table>

**Example: Optimizing Two Outer Joins Between DB2 Data Sources**

The following request joins the EMPINFO table to the JOBINFO table and the EDINFO table with the setting MULTIPATH=COMPOUND. The SET SQLJOIN OUTER ON command is required for DB2, which has OFF as its default value:

```
ENGINE DB2 SET SQLJOIN OUTER ON
SET MULTIPATH=COMPOUND
-RUN
SET TRACEUSER=ON
SET TRACEOFF=ALL
SET TRACEON = STMTRACE//CLIENT
-RUN

JOIN CLEAR *
-RUN

JOIN
  LEFT_OUTER CURR_JOBCODE IN EMPINFO TO MULTIPLE JOBCODE IN JOBINFO AS J0
END
JOIN
  LEFT_OUTER EMP_ID IN EMPINFO TO MULTIPLE EMP_ID IN EDINFO AS J1
END

TABLE FILE EMPINFO
PRINT LAST_NAME  FIRST_NAME IN 12 COURSE_NAME JOB_DESC
END
```
The single SQL SELECT statement incorporating all tables shows that the join is optimized:

```
SELECT T1."EID", T1."LN", T1."FN", T1."CJC", T2."E01", T2."CNM", T3."JCD", T3."JDS" FROM ( ( USERID1."EMPINFO" T1 LEFT OUTER JOIN USERID1."EDINFO" T2 ON T2."E01" = T1."EID" ) LEFT OUTER JOIN USERID1."JOBINFO" T3 ON T3."JCD" = T1."CJC" ) FOR FETCH ONLY;
```

All employees are included on the report output. Missing course names and job descriptions are indicated by the NODATA character (.):

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>FIRST_NAME</th>
<th>COURSE_NAME</th>
<th>JOB_DESC</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMITH</td>
<td>RICHARD</td>
<td>BASIC RPT NON-DP MGRS</td>
<td>PRODUCTION CLERK</td>
</tr>
<tr>
<td>GREENSPAN</td>
<td>MARY</td>
<td>.</td>
<td>SECRETARY</td>
</tr>
<tr>
<td>STEVENS</td>
<td>ALFRED</td>
<td>FILE DESCRIPT &amp; MAINT</td>
<td>SECRETARY</td>
</tr>
<tr>
<td>IRVING</td>
<td>JOAN</td>
<td>.</td>
<td>ASSIST.MANAGER</td>
</tr>
<tr>
<td>BANNING</td>
<td>JOHN</td>
<td>.</td>
<td>DEPARTMENT MANAGER</td>
</tr>
<tr>
<td>CROSS</td>
<td>BARBARA</td>
<td>HOST LANGUAGE INTERFACE</td>
<td>DEPARTMENT MANAGER</td>
</tr>
<tr>
<td>MCKNIGHT</td>
<td>ROGER</td>
<td>FILE DESCRIPT &amp; MAINT</td>
<td>PROGRAMMER</td>
</tr>
<tr>
<td>MCCOY</td>
<td>JOHN</td>
<td>.</td>
<td>PROGRAMMER</td>
</tr>
<tr>
<td>JONES</td>
<td>DIANE</td>
<td>FOCUS INTERNALS</td>
<td>PROGRAMMER ANALYST</td>
</tr>
<tr>
<td>ROMANS</td>
<td>ANTHONY</td>
<td>.</td>
<td>SYSTEMS ANALYST</td>
</tr>
<tr>
<td>BLACKWOOD</td>
<td>ROSEMARIE</td>
<td>DECISION SUPPORT WORKSHOP</td>
<td>SYSTEMS ANALYST</td>
</tr>
<tr>
<td>SMITH</td>
<td>MARY</td>
<td>BASIC REPORT PREP FOR PROG</td>
<td>FILE QUALITY</td>
</tr>
<tr>
<td>NEWMAN</td>
<td>FRED</td>
<td>.</td>
<td></td>
</tr>
</tbody>
</table>

**FMLCAP Function**

The FMLCAP function returns the caption value for each row in an FML hierarchy request. In order to retrieve caption values, the Master File must define an FML hierarchy and the request must use the GET CHILDREN, ADD, or WITH CHILDREN option to retrieve hierarchy data. If the FOR field in the request does not have a caption field defined, FMLCAP returns a blank string.

FMLCAP is supported for COMPUTE but is not recommended for use with DEFINE.
Syntax: **How to Retrieve Captions in an FML Request Using the FMLCAP Function**

FMLCAP(fieldname|'format')

where:

*fieldname*

Is the name of the caption field.

*'format'*

Is the format of the caption field enclosed in single quotation marks.

Example: **Retrieving FML Hierarchy Captions Using FMLCAP**

The following request retrieves and aggregates the FML hierarchy that starts with the parent value 2000. FMLCAP retrieves the captions, while the actual account numbers appear as the FOR values.

```
SET FORMULTIPLE = ON
TABLE FILE CENTSTMT
SUM ACTUAL_AMT
COMPUTE CAP1/A30= FMLCAP(GL_ACCOUNT_CAPTION);
FOR GL_ACCOUNT
  2000 WITH CHILDREN 2 ADD
END
```

The output is:

```
Actual  CAP1
------  -----
2000    313,611,852.  Gross Margin
2100    187,087,470.  Sales Revenue
2200    98,710,368.  Retail Sales
2300    13,798,832.  Mail Order Sales
2400    12,215,780.  Internet Sales
2500    100,885,159.  Cost Of Goods Sold
2600    54,877,250.  Variable Material Costs
2700    6,176,900.  Direct Labor
2800    3,107,742.  Fixed Costs
```
FMLFOR Function

FMLFOR retrieves the tag value associated with each row in an FML request. If the FML row was generated as a sum of data records using the OR phrase, FMLFOR returns the first value specified in the list. If the OR phrase was generated by an FML Hierarchy ADD command, FMLFOR returns the tag value associated with the parent specified in the ADD command.

The FMLFOR function is supported for COMPUTE but not for DEFINE. Attempts to use it in a DEFINE result in blank values.

Syntax: **How to Retrieve FML Tag Values**

FMLFOR(*outfield*)

where:

*outfield*

Is name of the field that will contain the result, or the format of the output value enclosed in single quotation marks.

Example:

Retrieving FML Tag Values With FMLFOR
**Example: Retrieving FML Tag Values With FMLFOR**

```plaintext
SET FORMULTIPLE = ON
TABLE FILE LEDGER
SUM AMOUNT
COMPUTE RETURNEDFOR/A8 = FMLFOR('A8');
FOR ACCOUNT
  1010 OVER
  1020 OVER
  1030 OVER
  BAR OVER
  1030 OR 1020 OR 1010
END
```

The output is:

```
| 1010 | 8,784 | 1010 |
| 1020 | 4,494 | 1020 |
| 1030 | 7,961 | 1030 |
```

**FMLLIST Function**

**How to:**

Retrieve an FML Tag List

**Example:**

Retrieving an FML Tag List With FMLLIST

FMLLIST returns a string containing the complete tag list for each row in an FML request. If a row has a single tag value, that value is returned.

The FMLLIST function is supported for COMPUTE but not for DEFINE. Attempts to use it in a DEFINE result in blank values.

**Syntax:**

**How to Retrieve an FML Tag List**

```plaintext
FMLLIST('A4096V')
```

where:

'A4096V'

Is the required argument.
Example: Retrieving an FML Tag List With FMLLIST

```
SET FORMULTIPLE=ON
TABLE FILE LEDGER
HEADING
"TEST OF FMLLIST"
""
SUM AMOUNT
COMPUTE LIST1/A36 = FMLLIST('A4096V');
FOR ACCOUNT
  '1010'       OVER
  '1020'       OVER
  '1030'       OVER
BAR         OVER
'1030' OR '1020' OR '1010'
END

The output is:

TEST OF FMLLIST

<table>
<thead>
<tr>
<th>AMOUNT</th>
<th>LIST1</th>
</tr>
</thead>
<tbody>
<tr>
<td>------</td>
<td>-----</td>
</tr>
<tr>
<td>1010</td>
<td>8,784</td>
</tr>
<tr>
<td>1020</td>
<td>4,494</td>
</tr>
<tr>
<td>1030</td>
<td>7,961</td>
</tr>
<tr>
<td>------</td>
<td>-----</td>
</tr>
</tbody>
</table>

1010 21,239 1010 OR 1020 OR 1030
```
Changing Titles of Columns Created Using Prefix Operators

**How to:**

Rename a Report Column Created Using a Prefix Operator

**Example:**

Renaming a Report Column Created Using a Prefix Operator

Column titles for columns created by applying a prefix operator to a display or sort field can be renamed using an AS phrase in a report request.

**Syntax:**

**How to Rename a Report Column Created Using a Prefix Operator**

`operator.fieldname AS 'coltitle'`

where:

- `operator`
  - Is a valid prefix operator.

- `fieldname`
  - Is a display or sort field in the request.

- `coltitle`
  - Is the column title for the report column, enclosed in single quotation marks.
Example: **Renaming a Report Column Created Using a Prefix Operator**

The following request sums wholesale prices of movies by category, counts the instances and sorts by the average wholesale price in descending order. The columns created with the AVE. and CNT. prefix operators are renamed using an AS phrase:

```
TABLE FILE MOVIES
SUM WHOLESALEPR CNT.WHOLESALEPR AS 'COUNT OF,WHOLESALEPR'
BY CATEGORY
   BY HIGHEST 2 TOTAL AVE.WHOLESALEPR AS 'AVERAGE OF,WHOLESALEPR'
   BY RATING
     WHERE CATEGORY EQ 'CLASSIC' OR 'FOREIGN' OR 'MUSICALS'
END
```

The output is:

## Joining Comma-Delimited Files

**How to:**

Specify a JOIN

**Reference:**

Usage Notes for Comma-Delimited Files in a Join

**Example:**

Joining Two Comma-Delimited Files

In FOCUS 7.6.2, a comma-delimited file can be the host or cross-referenced file in a JOIN command. The setting PCOMMA = ON must be in effect. Therefore, alphanumeric fields must be enclosed in double quotation marks and all of the data must be on a single line, with the line-end character indicating the end of record. This format is consistent with a HOLD file created as format COM or COMT. Note that files created by HOLD FORMAT COM or HOLD FORMAT COMT are created using the PCOMMA ON format, and thus PCOMMA must be set to ON in order to issue a report request against these files.
In comma-delimited files, the cross-referenced field can be any field. However, both the host and cross-referenced files must be retrieved in ascending order of the concatenated join fields.

**Syntax: How to Specify a JOIN**

```
JOIN [LEFT_OUTER|INNER] field1 [AND field1a...] IN host [TAG tag1]
TO [ALL|MULTIPLE|UNIQUE] field2 [AND field2a...] IN crfile [TAG tag2]
[AS joinname]
END
```

where:

- **field1**
  
  Is the name of a field in the host file containing values shared with a field in the cross-referenced file. This field is called the host field.

- **field1a...**
  
  Can be up to three additional fields in the host file. The phrase beginning with AND is required when specifying multiple fields.

- **INNER**
  
  Specifies an inner join. If you do not specify the type of join in the JOIN command, the ALL parameter setting determines the type of join to perform.

- **LEFT_OUTER**
  
  Specifies a left outer join. If you do not specify the type of join in the JOIN command, the ALL parameter setting determines the type of join to perform.

- **host**
  
  Is the name of the host file.

- **tag1**
  
  Is a tag name of up to eight characters (usually the name of the Master File), which is used as a unique qualifier for fields and aliases in the host file.
  
  The tag name for the host file must be the same in all the JOIN commands of a joined structure.
[ALL|MULTIPLE|UNIQUE]
Specifies whether a join is one-to-one or one-to-many.
UNIQUE returns only one instance and, if there is no matching instance in the cross-referenced file, it supplies default values (blank for alphanumeric fields and zero for numeric fields).
Use the MULTIPLE parameter when the cross-referenced field may have multiple instances in common with one value in the host file. Note that ALL is a synonym for MULTIPLE, and omitting this parameter entirely is a synonym for UNIQUE

Note: Many-to-many joins are not supported when the cross-referenced file is sequential.

field2
Is the name of a field in the cross-referenced file containing values that match those of field1 (or of concatenated host fields). This field is called the cross-referenced field and can be any field as long as the both data sources are in ascending order of the concatenation of join fields.

field2a...
Are the names of up to three fields in the cross-referenced file with values in common with their corresponding join fields in the host file.

tag2
Is a tag name of up to eight characters (usually the name of the Master File), which is used as a unique qualifier for fields and aliases in the cross-referenced file. In a recursive join structure, if no tag name is provided, all field names and aliases are prefixed with the first four characters of the join name.

joinname
Is an optional name of up to eight characters that you may assign to the join structure. You must assign a unique name to a join structure if:

- You want to ensure that a subsequent JOIN command does not overwrite it.
- You want to clear it selectively later.
- The structure is recursive.

Note: If you do not assign a name to the join structure with the AS phrase, the name is assumed to be blank. A join without a name overwrites an existing join without a name.

END
Is required when the JOIN command is longer than one line; it terminates the command.
Reference: Usage Notes for Comma-Delimited Files in a Join

- Both files in the join must be in ascending order of the concatenation of join fields. If the files are not in the same sort order, the following message is displayed:

  (FOC1071) VALUE FOR JOIN 'TO' FIELD OUT OF SEQUENCE. RETRIEVAL ENDED

- Many-to-many joins are not supported when the cross-referenced file is sequential. If multiple host field values match cross-referenced field values, the following message is generated:

  (FOC1072) DUPLICATES IN JOIN 'FROM' FIELD : filename/value

- A comma-delimited file used as the cross-referenced file must consist of a single segment.

Example: Joining Two Comma-Delimited Files

The following request creates a comma-delimited file from the ITEMS data source and another comma-delimited file from the VIDEOTRK data source, sorted in the same order. It then joins the two comma-delimited files and issues a report request against the joined files. In order to issue a request against a FORMAT COM data source, the PCOMMA parameter is set ON:

```plaintext
TABLE FILE ITEMS
PRINT PRODNAME OURCOST RETAILPR ON_HAND
BY PRODCODE
ON TABLE HOLD AS ITEMCOM FORMAT COM
END

TABLE FILE VIDEOTRK
PRINT LASTNAME FIRSTNAME
BY PRODCODE
WHERE LASTNAME NE 'NON-MEMBER'
ON TABLE HOLD AS VIDCOM FORMAT COM
END

JOIN PRODCODE IN VIDCOM TO PRODCODE IN ITEMCOM AS J1

SET PCOMMA = ON

TABLE FILE VIDCOM
PRINT LASTNAME FIRSTNAME PRODNAME
WHERE PRODNAME LIKE '%$SHIRT$'
END
```
Compiling DEFINEs With Missing Attributes

As of FOCUS 7.6.2, DEFINEs that have the missing attribute on either side of the equal sign can be compiled.

**SUBFOOT WITHIN**

How to:
Generate Subfoot Fields Calculated Within a Sort Break

Reference:
Usage Notes for SUBFOOT WITHIN

Example:
Generating a Subfoot Within a Sort Group

As of FOCUS 7.6.3, the WITHIN phrase can be added to a SUBFOOT command.

By adding the WITHIN phrase to a SUBFOOT command, you can create a subfooting whose fields are calculated within a sort field break. Without the WITHIN phrase, each SUBFOOT takes its field values from the report row directly above it on the report output. Calculating field values within a sort break is useful when applying a prefix operator to fields in the subfooting. If you do not specify a prefix operator when using WITHIN, the field is assigned the default prefix operator SUM, and produces a subtotal within the sort break.
**Syntax:**  

**How to Generate Subfoot Fields Calculated Within a Sort Break**

You can specify a subfoot in a BY phrase or in an ON phrase.

\[
\{\text{ON|BY}\} \text{byfield \text{SUBFOOT} [\text{WITHIN}] [\text{MULTILINES}]} \\
\quad \text{"text \langle\text{prefop.fieldname \ldots \rangle\text{"}}} \\
\quad \text{[WHEN \text{expression};\text{]}}
\]

where:

**byfield**

Is the sort field whose change in value generates the SUBFOOT.

**WITHIN**

Causes the fields in the SUBFOOT to be calculated within each value of `byfield`. Without this option, a field in the SUBFOOT is taken from the last line of report output above the subfooting.

**text**

Is the text you supply between double quotation marks that will be printed following the SUBFOOT phrase. The total number of subheads and subfoots in one report request may not exceed nine.

**prefop**

Is one of the following prefix operators: AVE., MIN., MAX., CNT., SUM., ASQ. If no prefix operator is specified, the default operator applied is SUM.

**fieldname**

Is field whose value will be printed in the subfooting calculated within the sort field value.

**MULTILINES**

Is used to suppress the SUBFOOT when there is only one line of output for the BY group. Note that MULTI-LINES is a synonym for MULTILINES.

**expression**

Specifies a conditional subfoot whose appearance on the report output is determined by a Boolean expression. WHEN must be placed on the line following the text you enclose in double quotation marks.
Reference: Usage Notes for SUBFOOT WITHIN

- SUBFOOT WITHIN is useful where a prefixed field within a sort break would result in a single value (for example, AVE., MIN, MAX). Use of PCT. or APCT. displays only the last value from the sort group.

- SUBFOOT WITHIN "<prefix.fieldname " does not result in the same value as SUBTOTAL prefix. The SUBFOOT WITHIN creates a display field that operates on the original input records. SUBTOTAL with a prefix operates on the internal matrix (so AVE. is the average of the SUMS or, if a display field had the prefix AVE., the average of the averages). SUBFOOT WITHIN "<AVE.field " generates an overall average.

- Prefix operators are not supported on alphanumeric fields in a WITHIN phrase.

- ST. is not supported in a SUBFOOT WITHIN phrase.
Example: Generating a Subfoot Within a Sort Group

The following request displays the average and minimum salary values first within department, then within department and job class, and last within department, job class and employee ID. Subfootings are generated on the department and jobcode sort fields. The DEFINE FILE command created two additional fields with the SALARY value, one for each sort break:

DEF FILE EMPDATA
SALDEPT/D6 WITH SALARY = SALARY;
SALDEPTJOB/D6 WITH SALARY = SALARY;
DEPT/A4 WITH SALARY = EDIT(DEPT, '9999');
JOB/A8 WITH SALARY = JOBCLASS;
END

TABLE FILE EMPDATA
SUM AVE.SALDEPT AS 'DEPT,AVE'
MIN.SALDEPT AS 'DEPT,MIN'
BY DEPT
SUM AVE.SALDEPTJOB AS 'DEPT/JOB, AVE' IN 32
MIN.SALDEPTJOB AS 'DEPT/JOB, MIN' IN 42
BY DEPT
BY JOB
PRINT AVE.SALARY/D6 AS 'AVE' IN 52
MIN.SALARY/D6 AS 'MIN' IN 61
BY DEPT
BY JOB
BY PIN NOPRINT
ON DEPT SUBFOOT
"********************DEPARTMENT <DEPT SUBFOOT**************************
"NOT WITHIN: AVE=<AVE.SALARY  MIN=<MIN.SALARY 
ON DEPT SUBFOOT WITHIN
"  WITHIN: AVE=<AVE.SALARY  MIN=<MIN.SALARY 
"********************DEPARTMENT <DEPT SUBFOOT**************************
"NOT WITHIN: AVE=<AVE.SALARY  MIN=<MIN.SALARY 
ON JOB SUBFOOT
"</1 ********************DEPARTMENT <DEPT / JOB <JOB SUBFOOT***************
"NOT WITHIN: AVE=<AVE.SALARY  MIN=<MIN.SALARY 
ON JOB SUBFOOT WITHIN
"  WITHIN: AVE=<AVE.SALARY  MIN=<MIN.SALARY 
"********************DEPARTMENT <DEPT SUBFOOT**************************  
WHERE DEPT EQ 'MARK'
WHERE JOBCLASS EQ '257PSB' OR '257PTB'
END
The report output shows that each SUBFOOT without the WITHIN phrase uses the report line above the subfooting in the calculations. The SUBFOOT within both department and jobcode uses the calculations that were specified in the second SUM command (by department by jobcode), and the SUBFOOT within department only uses the calculations that were specified in the first SUM command (by department):

<table>
<thead>
<tr>
<th>DEPT</th>
<th>DEPT</th>
<th>DEPT/JOB</th>
<th>DEPT/JOB</th>
</tr>
</thead>
<tbody>
<tr>
<td>----</td>
<td>----</td>
<td>--------</td>
<td>--------</td>

*******************************************************************
Output Format Enhancements

This chapter describes enhancements in saving or holding report output.

For additional information, see *Increased Length for HOLD Files in FOCUS Format* in Chapter 8, *Raised Limits*.

Topics:
- Saving Report Output in PowerPoint Format
- Preserving Leading and Internal Blanks in Report Output
- Structured HOLD Files
- SAVB FORMAT INTERNAL
- Excel Named Ranges
- Identifying Null Values in EXL2K Format Reports
- Creating PDF Files for Use With UNIX Systems
- Excel Table of Contents
- Excel Compound Reports
- Displaying An and AnV Fields With Line Breaks
- Creating HTML Reports With Absolute Positioning
- Excel Cell Locking
**Saving Report Output in PowerPoint Format**

**How to:**
Save Report Output in PowerPoint Format

**Example:**
Saving Report Output in PowerPoint Format

Report output can be styled and saved as a PowerPoint presentation. Each report page becomes a separate slide in the PowerPoint file.

**Syntax:** **How to Save Report Output in PowerPoint Format**

```
ON TABLE {HOLD|SAVE} [AS name] FORMAT PPT
```

where:

```
name
```

Assigns a name to the PowerPoint file. The file extension is ppt. The default name is HOLD.

**Example:** **Saving Report Output in PowerPoint Format**

The following request creates a two-page report using the MOVIES data source:

```
TABLE FILE MOVIES
HEADING CENTER
"PowerPoint Report Output"
"Page <TABPAGENO"
""
PRINT TITLE
BY DIRECTOR
WHERE DIRECTOR NE ' '
ON TABLE SAVE AS MOVIE2 FORMAT PPT

ON TABLE SET STYLE *
type=report, style=bold, color=black, backcolor=yellow, $
type=tabheading, style=bold, color=black, colspan=2,
   backcolor=yellow, $
type=data, backcolor=aqua, $
ENDSTYLE
END
```
The output consists of two slides in a presentation named movie2.ppt. The first report page becomes the first slide.

<table>
<thead>
<tr>
<th>DIRECTOR</th>
<th>TITLE</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADRAHANS J.</td>
<td>AIRPLANE</td>
</tr>
<tr>
<td>ALLEN W.</td>
<td>ANNIE HALL</td>

</tr>
</tbody>
</table>
Preserving Leading and Internal Blanks in Report Output

The second report page becomes the second slide.

Preserving Leading and Internal Blanks in Report Output

By default, HTML browsers and Excel remove leading and trailing blanks from text and compress multiple internal blanks to a single blank.

If you want to preserve leading and internal blanks in HTML and EXL2K report output, you can issue the SET SHOWBLANKS=ON command.

Even if you issue this command, trailing blanks will not be preserved except in heading, subheading, footing, and subfooting lines that use the default heading or footing alignment.
Syntax: **How to Preserve Leading and Internal Blanks in HTML and EXL2K Reports**

In a FOCEXEC, on the command line, or in a profile use the following syntax:

```
SET SHOWBLANKS = {OFF|ON}
```

In a request, use the following syntax:

```
ON TABLE SET SHOWBLANKS {OFF|ON}
```

where:

- **OFF**
  - Removes leading blanks and compresses internal blanks in HTML and EXL2K report output.

- **ON**
  - Preserves leading and internal blanks in HTML and EXL2K report output. Also preserves trailing blanks in heading, subheading, footing, and subfooting lines that use the default heading or footing alignment.

Example: **Preserving Leading and Internal Blanks in HTML and EXL2K Report Output**

The following request creates a virtual field that adds leading blanks to the value ACTION and both leading and internal blanks to the values TRAIN/EX and SCI/FI in the CATEGORY field. It also adds trailing blanks to the value COMEDY:

```
SET SHOWBLANKS = OFF
DEFINE FILE MOVIES
NEWCAT/A30 = IF CATEGORY EQ 'ACTION' THEN '  ACTION'
ELSE IF CATEGORY EQ 'SCI/FI' THEN 'SCIENCE   FICTION'
ELSE IF CATEGORY EQ 'TRAIN/EX' THEN '   TRAINING    EXERCISE'
ELSE IF CATEGORY EQ 'COMEDY' THEN 'COMEDY     '
ELSE 'GENERAL';
END
TABLE FILE MOVIES
SUM CATEGORY LISTPR/D12.2 COPIES
BY NEWCAT
ON TABLE HOLD FORMAT HTML
ON TABLE SET STYLE *
GRID=OFF, $
TYPE=REPORT, FONT=COURIER NEW, $
ENDSTYLE
END
Preserving Leading and Internal Blanks in Report Output

With SHOWBLANKS OFF, these additional blanks are removed:

<table>
<thead>
<tr>
<th>NEWCAT</th>
<th>CATEGORY</th>
<th>LISTPR</th>
<th>COPIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRAINING</td>
<td>EXERCISE TRAIN/EX</td>
<td>119.87</td>
<td>10</td>
</tr>
<tr>
<td>ACTION</td>
<td>ACTION</td>
<td>94.82</td>
<td>14</td>
</tr>
<tr>
<td>COMEDY</td>
<td>COMEDY</td>
<td>154.80</td>
<td>19</td>
</tr>
<tr>
<td>GENERAL</td>
<td>MYSTERY</td>
<td>1,216.82</td>
<td>67</td>
</tr>
<tr>
<td>SCIENCE</td>
<td>FICTION</td>
<td>114.84</td>
<td>7</td>
</tr>
</tbody>
</table>

With SHOWBLANKS ON, the additional leading and internal blanks are preserved. Note that trailing blanks are not preserved:

<table>
<thead>
<tr>
<th>NEWCAT</th>
<th>CATEGORY</th>
<th>LISTPR</th>
<th>COPIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRAINING</td>
<td>EXERCISE TRAIN/EX</td>
<td>119.87</td>
<td>10</td>
</tr>
<tr>
<td>ACTION</td>
<td>ACTION</td>
<td>94.82</td>
<td>14</td>
</tr>
<tr>
<td>COMEDY</td>
<td>COMEDY</td>
<td>154.80</td>
<td>19</td>
</tr>
<tr>
<td>GENERAL</td>
<td>MYSTERY</td>
<td>1,216.82</td>
<td>67</td>
</tr>
<tr>
<td>SCIENCE</td>
<td>FICTION</td>
<td>114.84</td>
<td>7</td>
</tr>
</tbody>
</table>
Structured HOLD Files

How to:
Activate Structured HOLD Files for a Request
Create a Structured HOLD File
Specify Options for Generating Structured HOLD Files

Reference:
Elements Included in a Structured HOLD File
Elements Not Included in a Structured HOLD File
Structural and Behavioral Notes

Example:
Creating a Structured HOLD File in ALPHA Format
Creating a Structured HOLD File in FOCUS Format
Reconstituting a Structured HOLD File
Excluding Fields From Structured HOLD Files

Structured HOLD Files facilitate migration of data sources and reports between operating environments.

Other HOLD formats capture data from the original sources and may retain some implicit structural elements from the request itself. However, they do not propagate most of the information about the original data sources accessed and their inter-relationships to the HOLD Master File or data source. Structured HOLD files, however, extract the data to a structure that parallels the original data sources. Subsequent requests against the HOLD file can use these retained data relationships to recreate the same types of relationships in other environments or in other types of data sources.

A Structured HOLD File can be created in ALPHA, BINARY, or FOCUS format:

- A Structured HOLD file created in either ALPHA or BINARY format is a flat file that saves the segment instances that contain the data that satisfy the conditions of the TABLE request. Multiple segments are generated based on the original structure read by the TABLE request. Segments are identified by assigning a RECTYPE for differentiation. Child segments in the original data source become a unique segment in the HOLD file.

- A Structured HOLD file in FOCUS format uses normal FOCUS segments to retain the original structure.
In all cases the HOLD file contains all of the original segment instances required to provide the complete report based on the TABLE request itself. Regardless of the display command used in the original request (PRINT, LIST, SUM, COUNT), the Structured HOLD File is created as if the request used PRINT. Aggregation is ignored.

The HOLD file contains either all of the fields in the structure identified by the request that are used to satisfy the request, or all of the display fields and BY fields. The file does not contain DEFINE fields not specifically referenced in the request. It does contain all fields needed to evaluate any DEFINE fields referenced in the request.

Structured HOLD files are only supported for TABLE and TABLEF commands. They can be created anywhere a HOLD file is supported. You must activate Structured HOLD files in a specific request by issuing the ON TABLE SET EXTRACT command in the request prior to creating the Structured HOLD File.

**Syntax:** How to Activate Structured HOLD Files for a Request

```
ON TABLE SET EXTRACT {ON | * | OFF}
```

where:

- **ON**
  - Activates Structured HOLD Files for this request and extracts all fields mentioned in the request.

- *****
  - Activates Structured HOLD Files for this request and indicates that a block of extract options follows. For example, you can exclude specific fields from the Structured HOLD File.

- **OFF**
  - Deactivates Structured HOLD files for this request. OFF is the default value.
**Syntax:** How to Create a Structured HOLD File

Before issuing the HOLD command, activate Structured HOLD Files for the request by issuing the ON TABLE SET EXTRACT command described in *How to Activate Structured HOLD Files for a Request* on page 118. Then issue the HOLD command to create the Structured HOLD File:

```
[ON TABLE] {HOLD|PCHOLD} [AS name] FORMAT {ALPHA|BINARY|FOCUS}
```

where:

*name*

Is the name of the HOLD file. If omitted, the name becomes HOLD by default.

*FORMAT*

Is ALPHA, BINARY or FOCUS

**Note:** You can issue a SET command to set the default HOLD format to either ALPHA or BINARY:

```
SET HOLDFORMAT=ALPHA
SET HOLDFORMAT=BINARY
```

**Syntax:** How to Specify Options for Generating Structured HOLD Files

To specify options for creating the extract, such excluding specific fields, use the * option of the SET EXTRACT command:

```
ON TABLE SET EXTRACT *
EXCLUDE = (fieldname1, fieldname2, fieldname3, ..., fieldnamen),$
FIELDS={ALL|EXPLICIT},$
ENDEXTRACT
ON TABLE HOLD AS name FORMAT {ALPHA|BINARY|FOCUS}
```

where:

*EXCLUDE* = (fieldname1, fieldname2, fieldname3, ..., fieldnamen)

Excludes the specified fields from the HOLD file.

,$

Is required syntax for delimiting elements in the extract block.

*ALL*

Includes all real fields and all DEFINE fields that are used in running the request.

*EXPLICIT*

Includes only those real fields and DEFINE fields that are in the display list or the BY sort field listing. DEFINE fields that are not explicitly referenced, and fields that are used to evaluate DEFINEs, are not included.
Structured HOLD Files

Example: Creating a Structured HOLD File in ALPHA Format

TABLE FILE EMPLOYEE
PRINT LAST_NAME FIRST_NAME JOBCODE ED_HRS
BY DEPARTMENT
BY HIGHEST SALARY
ON TABLE SET EXTRACT ON
ON TABLE HOLD FORMAT ALPHA
END

This request produces the following HOLD Master File:

FILENAME=HOLD, SUFFIX=FIX, $
SEGMENT=EMPINFO, SEGTYPE=S0, $
FIELDNAME=RECTYPE, ALIAS=R, USAGE=A3, ACTUAL=A3, $
FIELDNAME=LAST_NAME, ALIAS='LN', USAGE=A15, ACTUAL=A15, $
FIELDNAME=FIRST_NAME, ALIAS='FN', USAGE=A10, ACTUAL=A10, $
FIELDNAME=DEPARTMENT, ALIAS='DPT', USAGE=A10, ACTUAL=A10, $
FIELDNAME=ED_HRS, ALIAS='OJT', USAGE=F6.2, ACTUAL=A06, $
SEGMENT=PAYINFO, SEGTYPE=S0, PARENT=EMPINFO, $
FIELDNAME=RECTYPE, ALIAS=1, USAGE=A3, ACTUAL=A3, $
FIELDNAME=SALARY, ALIAS='SAL', USAGE=D12.2M, ACTUAL=A12, $
FIELDNAME=JOBCODE, ALIAS='JBC', USAGE=A3, ACTUAL=A03, $

Note the RECTYPE field generated for ALPHA or BINARY Structured HOLD files. Each record in the HOLD file begins with the RECTYPE to indicate the segment to which it belonged in the original structure. The root segment has RECTYPE=R. The RECTYPEs for other segments are sequential numbers assigned in top to bottom, left to right order.

Following are the first several records in the HOLD file:

R  STEVENS        ALFRED    PRODUCTION 25.00
1   11000.00A07
1   10000.00A07
R  SMITH          MARY      MIS        36.00
1   13200.00B14
1   12000.00B14
R  JONES          DIANE     MIS        50.00
1   18480.00B03
1   17750.00B02
R  SMITH          RICHARD   PRODUCTION 10.00
1   9500.00A01
1   9050.00B01
Example: Creating a Structured HOLD File in FOCUS Format

TABLE FILE EMPLOYEE
PRINT LAST_NAME FIRST_NAME JOBCODE ED_HRS
BY DEPARTMENT
BY HIGHEST SALARY
ON TABLE SET EXTRACT ON
ON TABLE HOLD FORMAT FOCUS
END

This request produces the following HOLD Master File:

FILENAME=HOLD , SUFFIX=FOC , $
  SEGMENT=EMPINFO, SEGTYPE=S0, $
    FIELDNAME=LAST_NAME, ALIAS='LN', USAGE=A15, $
    FIELDNAME=FIRST_NAME, ALIAS='FN', USAGE=A10, $
    FIELDNAME=DEPARTMENT, ALIAS='DPT', USAGE=A10, $
    FIELDNAME=ED_HRS, ALIAS='OJT', USAGE=F6.2, $
  SEGMENT=PAYINFO, SEGTYPE=S0, PARENT=EMPINFO, $
    FIELDNAME=SALARY, ALIAS='SAL', USAGE=D12.2M, $
    FIELDNAME=JOBCODE, ALIAS='JBC', USAGE=A3, $

Example: Reconstituting a Structured HOLD File

The following request reconstitutes the original FOCUS data source from the Structured HOLD File created in How to Creating a Structured HOLD File in ALPHA Format:

TABLE FILE HOLD
PRINT LAST_NAME FIRST_NAME JOBCODE ED_HRS
BY DEPARTMENT
BY HIGHEST SALARY
ON TABLE SET EXTRACT ON
ON TABLE HOLD AS RECONST FORMAT FOCUS
END

This request produces the following Master File:

FILENAME=RECONST , SUFFIX=FOC , $
  SEGMENT=EMPINFO, SEGTYPE=S0, $
    FIELDNAME=LAST_NAME, ALIAS='LN', USAGE=A15, $
    FIELDNAME=FIRST_NAME, ALIAS='FN', USAGE=A10, $
    FIELDNAME=DEPARTMENT, ALIAS='DPT', USAGE=A10, $
    FIELDNAME=ED_HRS, ALIAS='OJT', USAGE=F6.2, $
  SEGMENT=PAYINFO, SEGTYPE=S0, PARENT=EMPINFO, $
    FIELDNAME=SALARY, ALIAS='SAL', USAGE=D12.2M, $
    FIELDNAME=JOBCODE, ALIAS='JBC', USAGE=A3, $

The following request prints the report output:

```
TABLE FILE RECONST

**Example: Excluding Fields From Structured HOLD Files**

This request excludes the SALARY field used for sequencing.

```
TABLE FILE EMPLOYEE
PRINT LAST_NAME FIRST_NAME JOBCODE ED_HRS
BY DEPARTMENT
BY HIGHEST SALARY
ON TABLE SET EXTRACT *
EXCLUDE=(SALARY),$
ENDEXTRACT
ON TABLE HOLD FORMAT FOCUS
END
```

This request produces the following HOLD Master File:

```
FILENAME=HOLD , SUFFIX=FOC , $
SEGMENT=EMPINFO, SEGTYPE=S0, $
  FIELDNAME=LAST_NAME, ALIAS='LN', USAGE=A15, $
  FIELDNAME=FIRST_NAME, ALIAS='FN', USAGE=A10, $
  FIELDNAME=DEPARTMENT, ALIAS='DPT', USAGE=A10, $
  FIELDNAME=ED_HRS, ALIAS='OJT', USAGE=F6.2, $
SEGMENT=PAYINFO, SEGTYPE=S0, PARENT=EMPINFO, $
  FIELDNAME=JOBCODE, ALIAS='JBC', USAGE=A3, $
```

**Reference: Elements Included in a Structured HOLD File**

Structured HOLD files contain all original segment instances required to complete the TABLE or TABLEF request. Regardless of the verb used in the original request (PRINT, LIST, SUM, or COUNT), the structured HOLD file will be created as if the verb was PRINT.

Specifically, the extract file contains the following elements:

- All real fields named in the request such as display objects, sort fields, and fields used in selection criteria (WHERE/IF tests).
  
  Note that fields referenced multiple times in a request are included only once in the HOLD file.

- Fields used in FILTER FILE condition.

- Prefix operators are ignored except for ALL (which just affects the amount of data collected and does not imply a calculation).

- Field based reformatting (FIELD1/FIELD2=) causes the original field and the format field to be included.
A GROUP field if referenced explicitly or when all of its members are referenced in the request.

**Note:** If a group member is specifically excluded (EXCLUDE) or not referenced, its GROUP is not added to the extract Master File (this applies to nested and overlapping groups as well). If a GROUP and its elements are all named in a request, the GROUP is not added as a real field in the extract HOLD file.

- For FIELDS=ALL, all DEFINE fields used in the request become real fields in the structured HOLD File and are included along with other fields used in the DEFINE expression (including other DEFINE fields). Use EXCLUDE to reduce the number of fields included in the EXTRACT output.

- For FIELDS=EXPLICIT, display objects and sort fields are included. DEFINE fields become real fields if referenced in the request, but fields used to create them will not be included unless referenced explicitly. This reduces the number of fields returned in the request.

**Reference: Elements Not Included in a Structured HOLD File**

- Prefix operators on WHERE fields are evaluated in data selection but not included in the extract output.

- Prefix operators on display objects are ignored (except ALL).

- Using Structured HOLD File syntax in MATCH, MORE, and GRAPH requests produces error messages and exits the procedure.

- WHERE/IF TOTAL tests are not supported in Structured HOLD File requests and result in cancellation of the request.

- Reformatting of real fields is ignored (only the real field is included).

- Computed fields are not included, but fields used in COMPUTE expressions are included in the extract file.

**Reference: Structural and Behavioral Notes**

- Structured HOLD File requests are subject to the same limitations on number and size of fields as any other TABLE request.
Structural Notes

- The following SET parameters are turned off or ignored in Structured HOLD File requests:
  - AUTOINDEX
  - AUTOPATH
  - AUTOSTRATEGY
  - EXTHOLD
  - EXTSORT
  - HOLDATTR
- All SET and ON TABLE SET commands used to control output format are ignored in creating the extract file.

- Alternate views are respected and reflected in the structure of the extract file.

- Indexed views specified in the request are respected and reflected in the structure of the output file.

- If a request would generate a file containing two independent orphan segments because the parent segment is specifically excluded, a dummy system segment is created in the to act as parent of the two unrelated segments. There is only one instance of data for that segment. Both orphan segments refer to that system segment as parent. If the parent is missing because it was not mentioned in the request, it is activated during the request and included as the parent the segments.

- In the event that two unique (U) segments are included without the parent segment, the unique segments are converted to segments with SEGTYPE SO that reference the system segment as parent.

- JOIN and JOIN WHERE structures are supported.

SQL Optimization Notes

- SQL optimization for aggregation must be turned off for EXTRACT requests.

BY//ACROSS//FOR Notes

- BY and ACROSS sort fields become additional display objects.

- BY . . .ROWS and ACROSS . . .COLUMNS function only as implicit WHEREs to limit field values included.

- FOR fields are included.

- RECAP fields are excluded (like COMPUTEs).
Structured HOLD Files

- Summarization fields referencing previously identified fields are ignored in creating Structured HOLD Files. These include: SUMMARIZE, RECOMPUTE, SUBTOTAL, SUBTOTAL, ACROSS-TOTAL, ROW-TOTAL and COLUMN-TOTAL.

**Formatting Notes**

- Structured HOLD File processing ignores all formatting elements, including: IN, OVER, NOPRINT, SUP-PRINT, FOLD-LINE, SKIP-LINE, UNDER-LINE, PAGE-BREAK, TABPAGENO, AS, and column title justification. However, fields referenced within formatting commands, such as HEADING, FOOTING, SUBHEAD, and SUBFOOT, and any WHEN expressions associated with them, are included.

- All STYLE and STYLESHEET commands are ignored in producing extract output.

- AnV and AnW fields are supported. TX fields are exported in FOCUS files only.

- In the event that the FIELDNAME and ALIAS are the same for a real field and that field is redefined as itself (possibly with a different format), two fields are created in the HOLD Master File with identical field names and aliases. In this situation, the second version of the field can never be accessed if referenced by name. You can use FIELDS=EXPLICIT to include only the second version of the field. The following DEFINE illustrates and example of creating a duplicate field name and alias:

  ```
  DEFINE FILE CAR
  COUNTRY/A25=COUNTRY;
  END
  ```

**DBA Notes**

- DBA controls on source files are respected when running Structured HOLD File requests with the exception of RESTRICT=NOPRINT, where fields named in a request are not displayed (such fields cannot be exported and should be specifically EXCLUDED).

- DBA restrictions do not carry over to the HOLD Master File.

**Reconstituting Extract Files**

- To reconstitute a FOCUS or flat file from a Structured HOLD file, you use the same syntax used to generate the Structured HOLD File. The ON TABLE SET EXTRACT syntax must be used to preserve multipath structures.

- All reconstituted FOCUS segments are SEGTYPE=S0, as neither KEY nor INDEX information is retained. An INDEX can be reinserted using REBUILD INDEX.
SAVB FORMAT INTERNAL

**How to:**

Create a SAVB File With FORMAT INTERNAL

The SAVB command now supports FORMAT INTERNAL, which prevents padding of alphanumeric fields and enables you to supply format overrides for integer and packed fields that should not be padded with zeros.

When you create a SAVB file, no Master File is created. In addition, you can supply your own DCB attributes, such as record format and record length, by issuing a TSO ALLOCATE, DYNAM ALLOCATE, or CMS FILEDEF command prior to creating the output file.

**Syntax:  How to Create a SAVB File With FORMAT INTERNAL**

```
SET HOLDLIST = PRINTONLY
TABLE FILE filename
display_command filename/[In|Pn.d]..
ON TABLE SAVB AS name FORMAT INTERNAL
END
```

where:

- **PRINTONLY**
  
  Causes your report request to propagate the output file with only the specified fields displaying in the report output. If you do not issue this setting, an extra field containing the padded field length is included in the output file.

- **fieldname/[In|Pn.d]**
  
  Specifies formats for integer and packed fields for which you wish to suppress padding. These formats override the ACTUAL formats used for the display formats in the Master File.

  Note that floating point double-precision (D) and floating pointing point single-precision (F) fields are not affected by SAVB FORMAT INTERNAL.

- **FORMAT INTERNAL**
  
  Saves the SAVB file without padding for specified integer and packed decimal fields.
An Excel Named Range is a name assigned to a specific group of cells within an Excel worksheet that can be easily referenced by FOCUS applications. The FOCUS StyleSheet language facilitates the generation of Named Ranges.

The use of Excel Named Ranges provides many benefits, including the following:

- Provides advantages over static cell references, including the ability of named range data areas to expand to include new data added during scheduled workbook updates.
- Enables easy setup of Excel worksheets, created by FOCUS applications, as an ODBC (Open Database Connectivity) data source.
- Provides accurate, consistent data feeds to advanced Excel worksheet applications, which eliminates manual activities that tend to result in errors.
- Simplifies the process of referencing data in multiple worksheets. This is especially useful when named ranges are added to the output of an Excel Template report.
Syntax: **How to Use Excel Named Ranges**

To create Excel Named Ranges, use

```
TYPE=type, IN-RANGES=rangename, $
```

where:

* **type**
  
  Identifies the FOCUS report component to be included in the range. Normally, both of the following are used together:
  
  - **DATA** adds the DATA element of the report to the named range (excludes heading, footing, and column titles).
  - **TITLE** adds the TITLE element of the report to the named range (includes all column titles).

* **Note:** Multiple elements can be added to the same named range.

* **rangename**
  
  Is the name assigned to the output in the Excel workbook your application is creating, and is also the name that will be referenced by other FOCUS applications.

Example: **Using Excel Named Ranges**

This example creates one report in one worksheet of an Excel workbook. The code specific to Excel Named Ranges appears in bold in the following syntax.

```
TABLE FILE GGSALES
PRINT
  PRODUCT
  DATE
  UNITS
BY REGION
BY DOLLARS
ON TABLE SET PAGE-NUM OFF
ON TABLE SET BYDISPLAY ON
ON TABLE NOTOTAL
ON TABLE HOLD FORMAT EXL2K
ON TABLE SET STYLE *
  UNITS=IN, SQUEEZE=ON, ORIENTATION=PORTRAIT, $
  TYPE=REPORT, FONT='ARIAL', SIZE=9, COLOR='BLACK', BACKCOLOR='NONE',
  STYLE=NORMAL, $
  TYPE=DATA, IN-RANGES='RegionalSales', $
  TYPE=TITLE, STYLE=BOLD, IN-RANGES='RegionalSales', $
ENDSTYLE
END
```
The Excel output is:

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
<th>E</th>
<th>F</th>
</tr>
</thead>
<tbody>
<tr>
<td>Region</td>
<td>Dollar</td>
<td>Sales</td>
<td>Product</td>
<td>Date</td>
<td>Unit Sales</td>
</tr>
<tr>
<td>1</td>
<td>Midwest</td>
<td>748</td>
<td>Thermos</td>
<td>1996/08/01</td>

<td>Midwest</td>
<td>1069</td>
<td>Mug</td>
<td>1996/11/01</td>
<td>89</td>
</tr>
<tr>
<td>7</td>
<td>Midwest</td>
<td>1100</td>
<td>Croissant</td>
<td>1996/11/01</td>
<td>100</td>
</tr>
<tr>
<td>8</td>
<td>Midwest</td>
<td>1111</td>
<td>Espresso</td>
<td>1997/08/01</td>
<td>101</td>
</tr>
<tr>
<td>9</td>
<td>Midwest</td>
<td>1111</td>
<td>Latte</td>
<td>1996/11/01</td>
<td>101</td>
</tr>
<tr>
<td>10</td>
<td>Midwest</td>
<td>1230</td>
<td>Espresso</td>
<td>1996/07/01</td>
<td>123</td>
</tr>
<tr>
<td>11</td>
<td>Midwest</td>
<td>1247</td>
<td>Coffee Grinder</td>
<td>1996/06/01</td>
<td>125</td>
</tr>
</tbody>
</table>

The name assigned to this Excel Named Range is RegionalSales. If additional rows of data are added, or columns of data are inserted, the named range will stretch to contain both new and existing data.

**Reference: Rules for Excel Named Ranges**

- The Excel data area associated with a named range must be continuous and cannot contain any breaks in the data. Examples of report components containing breaks in the data that cannot be part of a named range include SUBHEAD and SUBFOOT.

- It is recommended that you use ON TABLE SET BYDISPLAY ON. This activates the option to display repeated sort values, which produces continuous output with no breaks in the data.

- Two different worksheets from the same workbook cannot have the same range name.

- When creating Compound Excel reports (multiple TABLE requests output to the same Excel workbook), each report must have a unique range name that is stored at the workbook level.
**Reference: Support for Excel Named Ranges**

Excel Named Ranges are supported for the following Excel formats:

**EXL2K, EXL2K FORMULA, EXL2K TEMPLATE**

Excel Named Ranges are not supported for the following Excel formats:

**EXL2K BYTOC, EXCEL PIVOT**

Excel Named Ranges are not supported with any report syntax that produces discontinuous data or uses columnar references that span multiple columns, which includes the following:

**ACROSCOLUMN, RECAP, RECOMPUTE, SUBHEAD, SUBFOOT, SUBTOTAL, SUB-TOTAL,**

**Identifying Null Values in EXL2K Format Reports**

**How to:**

Identify Null Values in EXL2K Report Output

**Example:**

Identifying Null Values in EXL2K Report Output

When a report is formatted as EXL2K, and null values are retrieved for one or more fields, blank spaces are displayed by default in each cell of the report output for the empty (null) fields. This behavior is the result of SET EMPTYCELLS ON being set by default in the background of all EXL2K reports. If you want to identify null values with something other than blank spaces, a character string can be used to populate all empty fields in a report.
Sytnax:  **How to Identify Null Values in EXL2K Report Output**

Outside of a report request, use the following syntax

```
SET NODATA = character_string
SET EMPTYCELLS = [ON|OFF]
```

In a report request, use the following syntax

```
ON TABLE SET NODATA character_string
ON TABLE SET EMPTYCELLS [ON|OFF]
```

where:

**character_string**

Is the string of characters displayed in the cells of the report for each field where null values are retrieved from the database. The maximum number of characters is 11. If the number of characters in the string exceeds the length of the output field, the additional characters will not be displayed. If special characters are used, the string must be enclosed in single quotes. SET EMPTYCELLS OFF must also be specified to make the SET NODATA command effective.

**ON**

Indicates that empty spaces are displayed in the cells of the report for each field where null values are retrieved from the database. ON is the default.

**OFF**

Indicates that zeros, or the character string specified with the SET NODATA command, will be displayed in the cells of the report for each field where null values are retrieved from the database. OFF must be specified when using SET NODATA.
**Example: Identifying Null Values in EXL2K Report Output**

The following syntax utilizes the default behavior of ON TABLE SET EMPTYCELLS ON, which is set in the background:

```plaintext
TABLE FILE CAR
    SUM SALES BY COUNTRY ACROSS SEATS
ON TABLE HOLD FORMAT EXL2K
END
```

The following output displays empty spaces in the cells of the report for each field where null values are retrieved from the database:

```
<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
<th>E</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>SEATS</td>
<td>2</td>
<td>4</td>
<td>5</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>COUNTRY</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>ENGLAND</td>
<td>0</td>
<td>0</td>
<td>12000</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>FRANCE</td>
<td></td>
<td></td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>ITALY</td>
<td>25400</td>
<td>4800</td>
<td></td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>JAPAN</td>
<td></td>
<td>78030</td>
<td></td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>W GERMANY</td>
<td>8900</td>
<td>79290</td>
<td></td>
<td></td>
</tr>
<tr>
<td>9</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```
Identifying Null Values in EXL2K Format Reports

The following syntax utilizes the SET NODATA command:

```
TABLE FILE CAR
   SUM SALES BY COUNTRY ACROSS SEATS
ON TABLE SET NODATA  'n/a'
ON TABLE SET EMPTYCELLS OFF
ON TABLE HOLD FORMAT EXL2K
END
```

**Note:** If you do not add SET EMPTYCELLS OFF, the SET NODATA command will be ignored.

The following output displays 'n/a' in the cells of the report for each field where null values are retrieved from the database:

```
<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
<th>E</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>SEATS</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
<td>2</td>
<td>4</td>
<td>5</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>COUNTRY</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>ENGLAND</td>
<td>0</td>
<td>0</td>
<td>12000</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>FRANCE</td>
<td>n/a</td>
<td>n/a</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>ITALY</td>
<td>25400</td>
<td>4800</td>
<td>n/a</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>JAPAN</td>
<td>n/a</td>
<td>78030</td>
<td>n/a</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>NW GERMANY</td>
<td>n/a</td>
<td>8900</td>
<td>79290</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```
The following syntax turns off the default SET EMPTYCELLS behavior and does not use SET NODATA, which makes it impossible to distinguish null values from zero quantities:

```
TABLE FILE CAR
  SUM SALES BY COUNTRY ACROSS SEATS
  ON TABLE SET EMPTYCELLS OFF
  ON TABLE HOLD FORMAT EXL2K
END
```

The following output displays zeros in the cells of the report for each field where either null values are retrieved from the database or the quantity is zero:

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
<th>E</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>COUNTRY</td>
<td>0</td>
<td>0</td>
<td>12000</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>FRANCE</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>ITALY</td>
<td>25400</td>
<td>4800</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>JAPAN</td>
<td>0</td>
<td>78030</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>W GERMANY</td>
<td>0</td>
<td>8900</td>
<td>79290</td>
<td></td>
</tr>
</tbody>
</table>

**Creating PDF Files for Use With UNIX Systems**

**How to:**

Specify Line Termination Characters When Creating a PDF File

**Reference:**

Required PDFLINETERM Settings Based on Environment

PDF files created with HOLD FORMAT PDF present a challenge if you work in an MVS or VM environment and use UNIX-based systems as the server for Adobe or as an intermediate transfer point.
The end of each PDF file has a table containing the byte offset, including line termination characters, of each PDF object in the file. The offsets indicate that each line is terminated by two characters, a carriage return and a line feed, which is the standard Windows text file format. However, records in a UNIX text file are terminated by one character, a line feed only. When using default settings, the offsets in a PDF file will be incorrect, causing an error when Acrobat attempts to open the file. If the file is then transferred in BINARY mode to Windows, it cannot be opened in Acrobat for Windows, as the carriage-return character was not inserted.

One solution has been to transfer the file to the UNIX system in text mode and then transfer in text mode to the Windows system, as the carriage return is added by the transfer facility when transferring to Windows.

If that is not possible or desirable, you can use the SET PDFLINETERM=SPACE command to facilitate binary transfer to Windows from an ASCII-based UNIX system. This command causes an extra space character to be appended to each record of the PDF output file. This extra space acts as a placeholder for the expected carriage return character and makes the object offsets in the file correct when it is transferred from MVS or VM to a UNIX system. This enables a UNIX server to open a PDF file in that environment.

**Note:** A text mode transfer is always required when transferring a text file from a mainframe to any other environment (Windows, ASCII Unix, or EBCDIC Unix).

**Syntax:**  
**How to Specify Line Termination Characters When Creating a PDF File**

In a profile, a FOCEXEC, or from the command line, issue the following command:

```
SET PDFLINETERM={STANDARD|SPACE}
```

In a TABLE request, issue the following command:

```
ON TABLE SET PDFLINETERM {STANDARD|SPACE}
```

where:

**STANDARD**

Creates a PDF file without any extra characters. This file will be a valid PDF file if transferred in text mode to a Windows machine, but not to a UNIX machine. If subsequently transferred from a UNIX machine to a Windows machine in text mode, it will be a valid PDF file on the Windows machine.

**SPACE**

Creates a PDF file with an extra space character appended to each record. This file will be a valid PDF file if transferred in text mode to a UNIX machine, but not to a Windows machine. If subsequently transferred from an ASCII UNIX machine to a Windows machine in binary mode, it will be a valid PDF file on the Windows machine.
Reference: Required PDFLINETERM Settings Based on Environment

The following chart will assist you in determining the correct setting to use, based on your environment:

<table>
<thead>
<tr>
<th>Transferring from MVS or VM to:</th>
<th>SET PDFLINETERM=</th>
</tr>
</thead>
<tbody>
<tr>
<td>EBCDIC UNIX (text transfer)</td>
<td>SPACE</td>
</tr>
<tr>
<td>ASCII UNIX (text transfer)</td>
<td>SPACE</td>
</tr>
<tr>
<td>ASCII UNIX (text); then to Windows (binary)</td>
<td>SPACE</td>
</tr>
<tr>
<td>UNIX (text); then to Windows (text)</td>
<td>STANDARD</td>
</tr>
<tr>
<td>Directly to Windows (text)</td>
<td>STANDARD</td>
</tr>
</tbody>
</table>

Excel Table of Contents

How to:
Use the Excel Table of Contents Feature

Reference:
How to Name Worksheets
Limitations of TOC Reports

Example:
Creating a Simple TOC Report

Excel Table of Contents (TOC) is a feature that enables you to generate a multiple worksheet report in which a separate worksheet is generated for each value of the first BY field in the FOCUS report.

Note: This feature can be used only with Excel 2002 or higher releases because it requires the Web Archive file format, which was not available in Excel 2000 and earlier releases.
Syntax: How to Use the Excel Table of Contents Feature

Only a single BY field is allowed in an EXL2K Table of Contents report.

ON TABLE HOLD FORMAT EXL2K BYTOC

Since only one level of TOC is allowed for EXL2K reports, the optional number following the BYTOC keyword can only be 1.

The SET COMPOUND syntax, which precedes the TABLE command, may also be used to specify that a TOC be created:

SET COMPOUND=BYTOC

Since a TOC report is burst into worksheets according to the value of the first BY field in the report, the report must contain at least one BY field. The bursting field may be a NOPRINT field.

Reference: How to Name Worksheets

- The worksheet tab names are the BY field values that correspond to the data on the current worksheet. If the user specifies the TITLETEXT keyword in the stylesheet, it will be ignored.

- Excel limits the length of worksheet titles to 31 characters. The following special characters cannot be used: ':', '?', '*', and '/'.

Reference: Limitations of TOC Reports

- A TOC report cannot be embedded in a compound report.

- A TOC report cannot be a pivot table report.

Note: FORMULA is not supported with bursting.
Example: Creating a Simple TOC Report

SET COMPOUND=BYTOC
TABLE FILE CAR
PRINT SALES BY COUNTRY NOPRINT BY CAR
ON TABLE HOLD FORMAT EXL2K
ON TABLE SET STYLE *
  type=report, style=bold, color=yellow, backcolor=black, $
  type=data, backcolor=red, $
  type=data, column=car, color=blue, backcolor=yellow, $
END

The output is:

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
<th>E</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAR</td>
<td></td>
<td>SALES</td>
<td></td>
<td></td>

Excel Compound Reports

Reference:
Guidelines for Using the OPEN, CLOSE, and NOBREAK Keywords and SET COMPOUND
Guidelines for Producing Excel Compound Reports

Example:
Creating a Simple Compound Report Using EXL2K
Creating a Compound Report With Pivot Tables and Formulas
Creating a Compound Report Using NOBREAK

Excel Compound Reports is a feature which enables you to generate multiple worksheet reports using the EXL2K output format.

The syntax of this feature is identical to that of PDF Compound Reports. By default, each of the component reports from the compound report is placed in a new Excel worksheet (analogous to a new page in PDF). If the NOBREAK keyword is used, the next report follows the current report on the same worksheet (analogous to starting the report on the same page in PDF).

Output is generated in Microsoft's Web Archive format. This format is labeled Single File Web Page in Excel's Save As dialog. Excel provides the conventionally given file types: MHT or MHTML. FOCUS uses the same XHT file type that is used for EXL2K reports.

The components of an Excel compound report can be FORMULA or PIVOT reports (subject to the restrictions). They cannot be Table of Contents (TOC) reports.

Note: Excel 2002 (Office XP) or higher must be installed. This feature will not work with earlier versions of Excel since they do not support the Web Archive file format.
Reference: Guidelines for Using the OPEN, CLOSE, and NOBREAK Keywords and SET COMPOUND

As with PDF, the keywords OPEN, CLOSE, and NOBREAK are used to control Excel compound reports. They can be specified with the HOLD command or with a separate SET COMPOUND command.

- OPEN is used on the first report of a sequence of component reports to specify that a compound report be produced.
- CLOSE is used to designate the last report in a compound report.
- NOBREAK specifies that the next report be placed on the same worksheet as the current report. If it is not present, the default behavior is to place the next report on a separate worksheet.

NOBREAK may appear with OPEN on the first report, or alone on a report between the first and last reports. (Using CLOSE is irrelevant, since it refers to the placement of the next report, and no report follows the final report on which CLOSE appears.)

- When used with the HOLD syntax, the compound report keywords OPEN, CLOSE, and NOBREAK must appear immediately after FORMAT EXL2K, and before any additional keywords, such as FORMULA or PIVOT. For example, you can specify:
  - ON TABLE HOLD FORMAT EXL2K OPEN
  - ON TABLE HOLD AS MYHOLD FORMAT EXL2K OPEN NOBREAK
  - ON TABLE HOLD FORMAT EXL2K NOBREAK FORMULA
  - ON TABLE HOLD FORMAT EXL2K CLOSE PIVOT PAGEFIELDS COUNTRY

- As with PDF compound reports, compound report keywords can be alternatively specified using SET COMPOUND:
  - SET COMPOUND = OPEN
  - SET COMPOUND = 'OPEN NOBREAK'
  - SET COMPOUND = NOBREAK
  - SET COMPOUND = CLOSE
Reference: Guidelines for Producing Excel Compound Reports

- **Pivot Tables and NOBREAK.** Pivot Table Reports may appear in compound reports, but they may not be combined with another report on the same worksheet using NOBREAK.

- **Naming of Worksheets.** The default worksheet tab names will be Sheet1, Sheet2, and so on. You have the option to specify a different worksheet tab name by using the TITLETEXT keyword in the stylesheet. For example:

  \[ \text{TYPE=REPORT, TITLETEXT='Summary Report', } \]$  

  Excel limits the length of worksheet titles to 31 characters. The following special characters cannot be used: ':', '?', '*', and '/'.

- **File Names and Formats.** The output file name (AS name, or HOLD by default) is obtained from the first report of the compound report (the report with the OPEN keyword). Output file names on subsequent reports are ignored.

  The HOLD FORMAT syntax used in the first component report in a compound report applies to all subsequent reports in the compound report, regardless of their format.

- **NOBREAK Behavior.** When NOBREAK is specified, the following report appears on the row immediately after the last row of the report with the NOBREAK. If additional spacing is required between the reports, a FOOTING or an ON TABLE SUBFOOT can be placed on the report with the NOBREAK, or a HEADING or an ON TABLE SUBHEAD can be placed on the following report. This allows the most flexibility, since if blank rows were added by default there would be no way to remove them.
Example: Creating a Simple Compound Report Using EXL2K

```
SET PAGE-NUM=OFF
TABLE FILE CAR
HEADING
"Sales Report"
""
SUM SALES
BY COUNTRY
ON TABLE SET STYLE *
type=report, titletext='Sales Rpt', $
type=heading, size=18, $
ENDSTYLE
ON TABLE HOLD AS EX1 FORMAT EXL2K OPEN
END

TABLE FILE CAR
HEADING
"Inventory Report"
""
SUM RC
BY COUNTRY
ON TABLE SET STYLE *
type=report, titletext='Inv. Rpt', $
type=heading, size=18, $
ENDSTYLE
ON TABLE HOLD FORMAT EXL2K
END

TABLE FILE CAR
HEADING
"Cost of Goods Sold Report"
""
SUM DC
BY COUNTRY
ON TABLE SET STYLE *
type=report, titletext='Cost Rpt', $
type=heading, size=18, $
ENDSTYLE
ON TABLE HOLD FORMAT EXL2K CLOSE
END
```
The output for each tab in the Excel worksheet is:

### Sales Report

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>

**Information Builders**
Example: Creating a Compound Report Using NOBREAK

In this example, the first two reports are on the first worksheet, and the last two reports are on the second worksheet, since NOBREAK appears on both the first and third reports.

TABLE FILE CAR
HEADING
"Report 1: England"
PRINT DCOST BY COUNTRY BY CAR
IF COUNTRY EQ ENGLAND
ON TABLE HOLD FORMAT EXL2K OPEN NOBREAK
ON TABLE SET STYLE *
type=report, color=red, $
type=data, backcolor=yellow, $
type=heading, color=blue, $
END

TABLE FILE CAR
HEADING
" "
" "
"Report 2: France"
PRINT RCOST BY COUNTRY
IF COUNTRY EQ FRANCE
ACROSS SEATS
ON TABLE HOLD FORMAT EXL2K
ON TABLE SET STYLE *
type=report, color=lime, backcolor=fuschia, style=bold, $
type=title, color=black, style=bold+italic, $
type=heading, backcolor=black, $
END

TABLE FILE CAR
FOOTING
"Report 3 - All"
PRINT SALES BY COUNTRY BY CAR
ON TABLE HOLD FORMAT EXL2K NOBREAK
ON TABLE SET STYLE *
type=report, backcolor=yellow, style=bold, $
type=title, color=blue, $
type=footing, backcolor=aqua, $
END
Excel Compound Reports

```
TABLE FILE CAR
HEADING
  " "
  " "
  " "
"Report 4"
PRINT SALES BY COUNTRY BY CAR
ON TABLE HOLD FORMAT EXL2K CLOSE
ON TABLE SET STYLE *
type=report, color=yellow, backcolor=black, style=bold, $
END

The output is:

<table>
<thead>
<tr>
<th>A1</th>

Displaying An and AnV Fields With Line Breaks

How to:
Display An and AnV Fields Containing Line Breaks on Multiple Lines

Example:
Displaying an Alphanumeric Field With Line Breaks in a PDF Report
Using an Alphanumeric Field With a Line Break in a Subfoot

Using StyleSheet attributes, you can display An (character) and AnV (varchar) fields that contain line breaks on multiple lines in a PDF or PostScript report. Line breaks can be based on line feeds, carriage returns, or a combination of both. If you do not add these StyleSheet attributes, all line feed and carriage return formatting within these fields will be ignored.

Syntax: How to Display An and AnV Fields Containing Line Breaks on Multiple Lines

TYPE=REPORT, LINEBREAK='type',$

where:

REPORT
Is the required component for the LINEBREAK attribute.

'type'
Specifies that line breaks will be inserted in a report based on the following:

LF inserts a line break after each line-feed character found in all An and AnV fields.

CR inserts a line break after each carriage-return character found in all An and AnV fields.

LFCR inserts a line break after each combination of a line-feed character followed by a carriage-return character found in all An and AnV fields.

CRLF inserts a line break after each combination of a carriage-return character followed by a line-feed character found in all An and AnV fields.

Note: The report output must be formatted as PDF or PostScript.
Example: Displaying an Alphanumeric Field With Line Breaks in a PDF Report

The following request defines an alphanumeric named ANLB field with a semi-colon in the middle. The CTRAN function then replaces the semi-colon with a carriage return character and stores this string in a field named ANLBC. On the report output, this field displays on two lines:

```
DEFINE FILE EMPLOYEE
ANLB/A40 = 'THIS IS AN An FIELD;WITH A LINE BREAK.';
ANLBC/A40 = CTRAN(40, ANLB, 094, 013 , ANLBC);
END
TABLE FILE EMPLOYEE
PRINT LAST_NAME ANLBC
WHERE LAST_NAME EQ 'BLACKWOOD'
ON TABLE HOLD FORMAT PDF
ON TABLE SET STYLE *
TYPE=REPORT,LINEBREAK='CR',$
ENDSTYLE
END
```

The output is:

```
LAST_NAME   ANLBC
------------
BLACKWOOD   THIS IS AN An FIELD
            WITH A LINE BREAK.
```
Example: Using an Alphanumeric Field With a Line Break in a Subfoot

The following request defines an alphanumeric named ANLB field with a semi-colon in the middle. The CTRAN function then replaces the semi-colon with a carriage return character and stores this string in a field named ANLBC. In the subfoot, this field displays on two lines:

```
DEFINE FILE EMPLOYEE
ANLB/A40 = 'THIS IS AN An FIELD; WITH A LINE BREAK.';
ANLBC/A40 = CTRAN(40, ANLB, 094, 013 , ANLBC);
END

TABLE FILE EMPLOYEE
PRINT FIRST_NAME
BY LAST_NAME
WHERE LAST_NAME EQ 'BLACKWOOD'
ON LAST_NAME SUBFOOT
 " "
     " <ANLBC "
ON TABLE HOLD FORMAT PDF
ON TABLE SET STYLE *
TYPE=REPORT,LINEBREAK='CR',$
ENDSTYLE
END
```

The output is:

```
LAST_NAME   FIRSTNAME
BLACKWOOD    ROSEMARIE

   THIS IS AN An FIELD
   WITH A LINE BREAK.
```
Creating HTML Reports With Absolute Positioning

**How to:**
Create Web Archive Report Output
Create a DHTML Report

**Reference:**
Usage Notes for Format DHTML

**Example:**
Creating a DHTML Report

Format DHTML provides HTML output that has most of the features normally associated with output formatted for printing such as PDF or PostScript output. You can create an HTML file (.htm) or a Web Archive file (.mht). The type of output file produced is controlled by the value of the HTMLARCHIVE parameter.

Some of the features supported by format DHTML are:

- **Absolute positioning.** DHTML precisely places text and images inside an HTML report, allowing you to use the same StyleSheet syntax to lay out HTML as you use for PDF or PS output.

- **On demand paging.** On demand paging is available with SET HTMLARCHIVE=OFF.

- **PDF StyleSheet features.** For example, the following features are supported: grids, background colors, OVER, .

**Syntax:**

**How to Create Web Archive Report Output**

```
SET HTMLARCHIVE = {ON|OFF}
```

where:

- **ON**
  Creates output in Web Archive format. The file type of the output file is MHT.

- **OFF**
  Creates output in HTML format. The file type of the output file is HTM. OFF is the default value.
Syntax: **How to Create a DHTML Report**

```
[ON TABLE] HOLD [AS name] FORMAT DHTML
```

where:

```
name
```

Specifies the name of the output file. The extension will be HTML if SET HTMLARCHIVE is OFF or MHT if SET HTMLARCHIVE is ON.

**Reference: Usage Notes for Format DHTML**

- The font map file for DHTML reports is DHTML FOCFTMAP on z/VM and is member DHTML in the ERRORS PDS on z/OS.
- Legacy compound reports are not supported.

**Example: Creating a DHTML Report**

The following example creates a DHTML file that has an image with absolute positioning:

```
SET HTMLARCHIVE = OFF
TABLE FILE GGSALES
SUM UNITS BY CATEGORY BY PRODUCT
ON TABLE SUBHEAD
"Report on Units Sold"
" "
" "
" "
" "
" "
" 
ON TABLE SET PAGE-NUM OFF
ON TABLE HOLD FORMAT DHTML
ON TABLE SET STYLE *
TYPE=TABHEADING,IMAGE=c:\images\GOTHAM.GIF, POSITION=(.25 .25),
  SIZE=(.5 .5), $ 
ENDSTYLE
END
```
The output shows that the look and positioning are the same as they would be for a PDF report:

**Report on Units Sold**

<table>
<thead>
<tr>
<th>Category</th>
<th>Product</th>
<th>Unit Sales</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coffee</td>
<td>Capuccino</td>
<td>189217</td>

</tbody>
</table>

**Excel Cell Locking**

**How to:**

Enable Spreadsheet Locking

Lock Specific Cells Within a Spreadsheet

**Example:**

Locking an Entire Excel Spreadsheet

Locking a Single Column on an Excel Spreadsheet

Starting in Version 7.6.5, you can make cells in an Excel spreadsheet read-only.

Using StyleSheet attributes, you can lock Excel spreadsheet values so they are read-only. These attributes apply to all Excel formats including EXL2K, EXL2K PIVOT, and EXL2K FORMULA.
Excel Cell Locking

Syntax: **How to Enable Spreadsheet Locking**

To enable locking, use the following attributes:

```
TYPE=REPORT, PROTECTED={ON|OFF}, [LOCKED={ON|OFF}],$
```

where:

```
TYPE=REPORT, PROTECTED=ON
```

Is necessary to enable spreadsheet locking. PROTECTED=OFF is the default. If you omit the LOCKED=OFF attribute, the entire spreadsheet is locked.

```
LOCKED=ON
```

Locks the entire spreadsheet. ON is the default value.

```
LOCKED=OFF
```

Unlocks the spreadsheet as a whole, but enables you to lock or unlock specific cells or groups of cells.

Syntax: **How to Lock Specific Cells Within a Spreadsheet**

Once you include the following declaration in your StyleSheet, you can specify the LOCKED attribute for specific cells or groups of cells:

```
TYPE=REPORT, PROTECTED=ON, LOCKED=OFF,$
```

To lock specific parts of the spreadsheet, add the LOCKED=ON attribute to the StyleSheet declaration for the cells you want to lock.

```
TYPE=type, [ COLUMN=columnspec ] ,LOCKED={ON|OFF},$
```

where:

```
type
```

Is the type of element that describes the cells to be locked.

```
columnspec
```

Is a valid column specification.
Example: **Locking an Entire Excel Spreadsheet**

The following request locks the entire spreadsheet because the StyleSheet declarations include the following declaration:

```
TYPE=REPORT, PROTECTED=ON, $
```

The request is:

```
TABLE FILE CAR
HEADING
"Profit By Car"
"
SUM RETAIL_COST AND DEALER_COST AND
COMPUTE PROFIT/D12.2 = RETAIL_COST - DEALER_COST;
BY CAR
ON TABLE SET PAGE-NUM OFF
ON TABLE HOLD AS EXLFORM1 FORMAT EXL2K
ON TABLE SET STYLE *
  TYPE=REPORT, COLOR=BLUE, BACKCOLOR=SILVER, SIZE=9, $
  TYPE=REPORT, PROTECTED=ON,            $
  TYPE=HEADING, STYLE=BOLD, SIZE=14, $
  TYPE=TITLE, STYLE=BOLD, SIZE=11, $
ENDSTYLE
END
```

You cannot edit any value on the spreadsheet. Any attempt to do so displays a message that the sheet is protected:
**Excel Cell Locking**

**Example: Locking a Single Column on an Excel Spreadsheet**

The following request locks the second column (RETAIL_COST) because the StyleSheet declarations include the following declarations:

```plaintext
TYPE=REPORT, PROTECTED=ON, LOCKED=OFF,$
TYPE=DATA, COLUMN=2, LOCKED=ON,$
```

The request is:

```plaintext
TABLE FILE CAR
HEADING
"Profit By Car "
" "
SUM RETAIL_COST AND DEALER_COST AND
COMPUTE PROFIT/D12.2 = RETAIL_COST - DEALER_COST;
BY CAR
ON TABLE SET PAGE-NUM OFF
ON TABLE HOLD AS EXLFORM2 FORMAT EXL2K
ON TABLE SET STYLE *
TYPE=REPORT, COLOR=BLUE, BACKCOLOR=SILVER, SIZE=9,$
TYPE=REPORT, PROTECTED=ON, LOCKED=OFF,$
TYPE=HEADING, STYLE=BOLD, SIZE=14, $
TYPE=TITLE, STYLE=BOLD, SIZE=11,$
TYPE=DATA, COLUMN=2, LOCKED=ON,$
ENDSTYLE
END
```

You cannot edit any value in column 2, although you can edit values in other columns. Any attempt to edit a value in column 2 displays a message that the cells are protected:

![Excel cell locking message](image)
General Enhancements

This chapter describes features that work in multiple FOCUS environments.

Topics:

- DB_LOOKUP: Retrieving a Value From a Lookup Data Source
- HEXTR and HMASK Date-Time Functions
- Specifying Precision for Dialogue Manager Calculations
- Displaying SET Parameters by Functional Area
- New QUOTEP Option for Continental Decimal Notation
- Establishing a Default Value for the &ECHO Variable
- Retrieving the Site Code of the Connected User
- Establishing a Non-Overridable User Password
- Creating a Standard Quote-Delimited String
- Assignment Between Text Fields and Alphanumeric Fields
- DATETRAN Function
- Extensions to Date-Time Formats
- MIRR Function
- XIRR Function
- PTOA Function
- PUTDDREC and CLSDDREC Functions
- SET ERROROUT = OVERRIDE
- STRREP Function
- FOCREPLAY: Recording and Playing Back a FOCUS Session
- &FOCFEXNAME Variable
- Controlling Missing Values in Reformatted Fields
- Controlling Case Sensitivity of Passwords
- SLEEP Function
- Setting a Currency Symbol for the M and N Format Options
- ISO Standard Week Numbering and the HYYWD Function
- PATTERN Function
- REVERSE Function
- XTPACK Function
- Alternate Extended Currency Symbol
- SET SUWEDGE
DB_LOOKUP: Retrieving a Value From a Lookup Data Source

How to:
Retrieve a Value From a Lookup Data Source

Example:
Retrieving a Value From a Fixed Format Sequential File in a TABLE Request

Reference:
Usage Notes for DB_LOOKUP

The DB_LOOKUP function enables you to retrieve a value from one data source when running a request against another data source, without joining or combining the two data sources.

DB_LOOKUP compares pairs of fields from the source and lookup data sources to locate matching records and retrieve the value to return to the request. You can specify as many pairs as needed to get to the lookup record that has the value you want to retrieve. If your field list pairs do not lead to a unique lookup record, the first matching lookup record retrieved is used.

DB_LOOKUP can be called in a DEFINE command, TABLE COMPUTE command, or MODIFY COMPUTE command.

There are no restrictions on the source file. The lookup file can be any non-FOCUS data source that is supported as the cross referenced file in a cluster join. The lookup fields used to find the matching record are subject to the rules regarding cross-referenced join fields for the lookup data source. A fixed format sequential file can be the lookup file if it is sorted in the same order as the source file.

Syntax: How to Retrieve a Value From a Lookup Data Source

```
DB_LOOKUP(look_mf, srcfld1, lookfld1, srcfld2, lookfld2, ..., returnfld);
```

where:

- `look_mf`
  - Is the lookup Master File.

- `srcfld1, srcfld2 ...`
  - Are fields from the source file used to locate a matching record in the lookup file.

- `lookfld1, lookfld2 ...`
  - Are columns from the lookup file that share values with the source fields. Only columns in the table or file can be used; columns created with DEFINE cannot be used. For multi-segment synonyms only columns in the top segment can be used.
**returnfld**

Is the name of a column in the lookup file whose value is returned from the matching lookup record. Only columns in the table or file can be used; columns created with DEFINE cannot be used.

**Reference: Usage Notes for DB_LOOKUP**

- The maximum number of pairs that can be used to match records is 63.

- If the lookup file is a fixed format sequential file, it must be sorted and retrieved in the same order as the source file. The sequential file’s key field must be the first lookup field specified in the DB_LOOKUP request. If it is not, no records will match.

In addition, if a DB_LOOKUP request against a sequential file is issued in a DEFINE FILE command, you must clear the DEFINE FILE command at the end of the TABLE request that references it or the lookup file will remain open. It will not be reusable until closed and may cause problems when you exit FOCUS. Other types of lookup files can be reused without clearing the DEFINE. They will be cleared automatically when all DEFINE fields are cleared.

- If the lookup field has the MISSING=ON attribute in its Master File and the DEFINE or COMPUTE command specifies MISSING ON, the missing value is returned when the lookup field is missing. Without MISSING ON in both places, the missing value is converted to a default value (blank for an alphanumeric field, zero for a numeric field).

- Source records display on the report output even if they lack a matching record in the lookup file.

- Only real fields in the lookup Master File are valid as lookup and return fields.

- If there are multiple rows in the lookup table where the source field is equal to the lookup field, the first value of the return field is returned.
Example: **Retrieving a Value From a Fixed Format Sequential File in a TABLE Request**

The following procedure creates a fixed format sequential file named GSALE from the GGSALES data source. The fields in this file are PRODUCT (product description), CATEGORY (product category), and PCD (product code). The file is sorted on the PCD field:

```
SET ASNAMES = ON
TABLE FILE GGSALES
SUM PRODUCT CATEGORY
BY PCD
ON TABLE HOLD AS GSALE FORMAT ALPHA
END
```

The following Master File is generated as a result of the HOLD command:

```
FILENAME=GSALE, SUFFIX=FIX, $
  SEGMENT=GSALE, SEGTYPE=S1, $
    FIELDNAME=PCD, ALIAS=E01, USAGE=A04, ACTUAL=A04, $
    FIELDNAME=PRODUCT, ALIAS=E02, USAGE=A16, ACTUAL=A16, $
    FIELDNAME=CATEGORY, ALIAS=E03, USAGE=A11, ACTUAL=A11, $
END
```

The following TABLE request against the GGPRODS data source, sorts the report on the field that matches the key field in the lookup file. It retrieves the value of the CATEGORY field from the GSALE lookup file by matching on the product code and product description fields. Note that the DEFINE FILE command is cleared at the end of the request:

```
DEFINE FILE GGPRODS
PCAT/A11 MISSING ON = DB_LOOKUP(GSALE, PRODUCT_ID, PCD, 
  PRODUCT_DESCRIPTION, PRODUCT, CATEGORY);
END
TABLE FILE GGPRODS
PRINT PRODUCT_DESCRIPTION PCAT
BY PRODUCT_ID
END
DEFINE FILE GGPRODS CLEAR
END
```
Because the GSALE Master File does not define the CATEGORY field with the \MISSING=ON attribute, the PCAT column displays a blank in those rows that have no matching record in the lookup file:

<table>
<thead>
<tr>
<th>Product Code</th>
<th>Product</th>
<th>PCAT</th>
</tr>
</thead>
<tbody>
<tr>
<td>B141</td>
<td>Hazelnut</td>
<td></td>
</tr>
<tr>
<td>B142</td>
<td>French Roast</td>
<td></td>
</tr>
<tr>
<td>B144</td>
<td>Kona</td>
<td></td>
</tr>
<tr>
<td>F101</td>
<td>Scone</td>
<td>Food</td>
</tr>
<tr>
<td>F102</td>
<td>Biscotti</td>
<td>Food</td>
</tr>
<tr>
<td>F103</td>
<td>Croissant</td>
<td>Food</td>
</tr>
<tr>
<td>G100</td>
<td>Mug</td>
<td>Gifts</td>
</tr>
<tr>
<td>G104</td>
<td>Thermos</td>
<td>Gifts</td>
</tr>
<tr>
<td>G110</td>
<td>Coffee Grinder</td>
<td>Gifts</td>
</tr>
<tr>
<td>G121</td>
<td>Coffee Pot</td>
<td>Gifts</td>
</tr>
</tbody>
</table>

If you add the \MISSING=ON attribute to the CATEGORY field in the GSALE Master File, the PCAT column displays a missing data symbol in rows that do not have a matching record in the lookup file:

<table>
<thead>
<tr>
<th>Product Code</th>
<th>Product</th>
<th>PCAT</th>
</tr>
</thead>
<tbody>
<tr>
<td>B141</td>
<td>Hazelnut</td>
<td>.</td>
</tr>
<tr>
<td>B142</td>
<td>French Roast</td>
<td>.</td>
</tr>
<tr>
<td>B144</td>
<td>Kona</td>
<td>.</td>
</tr>
<tr>
<td>F101</td>
<td>Scone</td>
<td>Food</td>
</tr>
<tr>
<td>F102</td>
<td>Biscotti</td>
<td>Food</td>
</tr>
<tr>
<td>F103</td>
<td>Croissant</td>
<td>Food</td>
</tr>
<tr>
<td>G100</td>
<td>Mug</td>
<td>Gifts</td>
</tr>
<tr>
<td>G104</td>
<td>Thermos</td>
<td>Gifts</td>
</tr>
<tr>
<td>G110</td>
<td>Coffee Grinder</td>
<td>Gifts</td>
</tr>
<tr>
<td>G121</td>
<td>Coffee Pot</td>
<td>Gifts</td>
</tr>
</tbody>
</table>
HEXTR and HMASK Date-Time Functions

How to:
Extract Multiple Components From a Date-Time Value
Move Multiple Date-Time Components to a Target Date-Time Field

Example:
Extracting Hour and Minute Components Using HEXTR
Changing a Date-Time Field Using HMASK

Reference:
Usage Notes for the HMASK Function

The HEXTR function extracts one or more components from a date-time value and moves them to a target date-time field with all other components set to zero.

The HMASK function extracts one or more components from a date-time value and moves them to a target date-time field with all other components of the target field preserved.

Syntax: **How to Extract Multiple Components From a Date-Time Value**

HEXTR(source, 'componentstring', length, outfield)

where:

*source*
Is the a date-time value from which to extract the specified components.

*componentstring*
Is a string of codes, in any order, that indicates which components are to be extracted and moved to the output date-time field. The following table shows the valid values. The string is considered to be terminated by any character not in this list:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>century (the two high-order digits only of the four-digit year)</td>
</tr>
<tr>
<td>Y</td>
<td>year (the two low-order digits only of the four-digit year)</td>
</tr>
<tr>
<td>YY</td>
<td>Four digit year.</td>
</tr>
<tr>
<td>M</td>
<td>month</td>
</tr>
<tr>
<td>D</td>
<td>day</td>
</tr>
</tbody>
</table>
length
Is the length of the returned date-time value. Valid values are:
8 - indicates a time value that includes milliseconds.
10 - indicates a time value the includes microseconds.

outfield
Is the field that contains the result, or the format of the output value enclosed in single quotation marks. This field must be in date-time format (data type H).

Example: Extracting Hour and Minute Components Using HEXTR
The VIDEOTR2 data source has a date-time field named TRANSDATE of type HYYMDI. The following request selects all records containing the time 09:18AM, regardless of the value of the remaining components:

```
TABLE FILE VIDEOTR2
PRINT TRANSDATE
BY LASTNAME
BY FIRSTNAME
WHERE HEXTR(TRANSDATE, 'HI', 8, 'HYYMDI') EQ DT(09:18AM)
END
```

The output is:

```
LASTNAME      FIRSTNAME      TRANSDATE
-----------      ---------      ---------
DIZON           JANET       1999/11/05 09:18
PETERSON        GLEN        1999/09/09 09:18
```
**Syntax:**  **How to Move Multiple Date-Time Components to a Target Date-Time Field**

```
HMASK(source, 'componentstring', input, length, outfield)
```

where:

- **source**
  Is the date-time value from which the specified components are extracted.

- **componentstring**
  Is a string of codes, in any order, that indicates which components are to be extracted and moved to the output date-time field. The following table shows the valid values. The string is considered to be terminated by any character not in this list:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>century (the two high-order digits only of the four-digit year)</td>
</tr>
<tr>
<td>Y</td>
<td>year (the two low-order digits only of the four-digit year)</td>
</tr>
<tr>
<td>YY</td>
<td>Four digit year.</td>
</tr>
<tr>
<td>M</td>
<td>month</td>
</tr>
<tr>
<td>D</td>
<td>day</td>
</tr>
<tr>
<td>H</td>
<td>hour</td>
</tr>
<tr>
<td>I</td>
<td>minutes</td>
</tr>
<tr>
<td>S</td>
<td>seconds</td>
</tr>
<tr>
<td>S</td>
<td>milliseconds (the three high-order digits of the six-digit microseconds value)</td>
</tr>
<tr>
<td>u</td>
<td>microseconds (the three low-order digits of the six-digit microseconds value)</td>
</tr>
<tr>
<td>m</td>
<td>All six digits of the microseconds value.</td>
</tr>
</tbody>
</table>

- **input**
  Is the date-time value that provides all the components for the output that are not specified in the component string.

- **length**
  Is the length of the returned date-time value. Valid values are:
  8 - indicates a time value that includes milliseconds.
  10 - indicates a time value the includes microseconds.
outfield

Is the field that contains the result, or the format of the output value enclosed in single quotation marks. This field must be in date-time format (data type H).

Reference: Usage Notes for the HMASK Function

HMASK processing is subject to the DTSTRICT setting. Moving the day (D) component without the month (M) component could lead to an invalid result, which is not permitted if the DTSTRICT setting is ON. Invalid date-time values cause any date-time function to return zeroes.

Example: Changing a Date-Time Field Using HMASK

The VIDEOTRK data source has a date-time field named TRANSDATE of format HYYMDI. The following request changes any TRANSDATE value with a time component greater than 11:00 to 8:30 of the following day. First the HEXT function extracts the hour and minutes portion of the value and compares it to 11:00. If it is greater than 11:00, the HADD function calls HMASK to change the time to 08:30 and adds one day to the date:

```
DEFINE FILE VIDEOTR2
ORIG_TRANSDATE/HYYMDI = TRANSDATE;
TRANSDATE =
IF HEXT(TRANSDATE, 'HI', 8, 'HHI') GT DT(12:00)
THEN HADD (HMASK(DT(08:30), 'HISs', TRANSDATE, 8, 'HYYMDI'), 'DAY',
1,8, 'HYYMDI')
ELSE TRANSDATE;
END
```

```
TABLE FILE VIDEOTR2
PRINT ORIG_TRANSDATE TRANSDATE
BY LASTNAME
BY FIRSTNAME
WHERE ORIG_TRANSDATE NE TRANSDATE
END
```

The output is:

<table>
<thead>
<tr>
<th>LASTNAME</th>
<th>FIRSTNAME</th>
<th>ORIG_TRANSDATE</th>
<th>TRANSDATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>BERTAL</td>
<td>MARCIA</td>
<td>1999/07/29 12:19</td>
<td>1999/07/30 08:30</td>
</tr>
<tr>
<td>GARCIA</td>
<td>JOANN</td>
<td>1998/05/08 12:48</td>
<td>1998/05/09 08:30</td>
</tr>
<tr>
<td>PARKER</td>
<td>GLENDA</td>
<td>1999/11/30 12:12</td>
<td>1999/12/01 08:30</td>
</tr>
<tr>
<td>RATHER</td>
<td>MICHAEL</td>
<td>1999/01/06 12:22</td>
<td>1999/01/07 08:30</td>
</tr>
<tr>
<td>WILSON</td>
<td>KELLY</td>
<td>1999/06/26 12:34</td>
<td>1999/06/27 08:30</td>
</tr>
</tbody>
</table>
Specifying Precision for Dialogue Manager Calculations

How to:
Specify Precision for Dialogue Manager Calculations

Example:
Rounding Using DMPRECISION

Reference:
Usage Notes for SET DMPRECISION

This setting enables Dialogue Manager -SET commands to display and store accurate numeric variable values without using the FTOA function.

Without this setting, results of numeric calculations are returned as integer numbers, although the calculations themselves employ double-precision arithmetic. To return a number with decimal precision without this setting, you have to enter the calculation as input into subroutine FTOA, where you can specify the number of decimal places returned.

The SET DMPRECISION command gives users the option of either accepting the default truncation of the decimal portion of output from arithmetic calculations, or specifying up to nine decimal places for rounding.

Syntax: How to Specify Precision for Dialogue Manager Calculations

Issue the following command in any supported profile, or in a focexec, or at the command prompt:

```
SET DMPRECISION = {OFF | n}
```

where:

**OFF**

Specifies truncation without rounding after the decimal point. OFF is the default value.

**n**

Is a positive number from 0-9, indicating the point of rounding. Note that n=0 results in a rounded integer value.
Example: **Rounding Using DMPRECISION**

The following table below shows the result of dividing 20 by 3 with varying DMPRECISION (DMP) settings:

<table>
<thead>
<tr>
<th>SET DMPRECISION</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>6</td>
</tr>
<tr>
<td>0</td>
<td>7</td>
</tr>
<tr>
<td>1</td>
<td>6.7</td>
</tr>
<tr>
<td>2</td>
<td>6.67</td>
</tr>
<tr>
<td>9</td>
<td>6.666666667</td>
</tr>
</tbody>
</table>

Reference: **Usage Notes for SET DMPRECISION**

- When using SET DMPRECISION, you must include `-RUN` after the SET DMPRECISION command to ensure that it is set prior to any numeric `-SET` commands.
- As the actual conversion to double precision follows the rules for the operating system, the values may vary from platform to platform.

**Displaying SET Parameters by Functional Area**

**How to:**
- Display SET Parameter Values Categorized by Functional Areas
- Display SET Parameter Values for a Specific Functional Area
- Display the List of Categories

**Example:**

Viewing Parameters by Functional Category

The `? SET BY CATEGORY` query allows users to display settable parameter values grouped by major functional categories.
### Syntax: How to Display SET Parameter Values Categorized by Functional Areas

Issue the following command in any supported profile, or in a focexec, or at the command prompt, to display settable parameter values by functional area:

```plaintext
? SET BY CATEGORY
```

The functional areas available for display are listed below.

<table>
<thead>
<tr>
<th>Functional Area</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMORY</td>
<td>Options that affect size of memory used.</td>
</tr>
<tr>
<td>DATES</td>
<td>Options that control date input/output.</td>
</tr>
<tr>
<td>SECURITY</td>
<td>Security options.</td>
</tr>
<tr>
<td>POOLTABLE</td>
<td>Options relevant only to POOLTABLE.</td>
</tr>
<tr>
<td>SINK</td>
<td>Options relevant only to SINK MACHINES.</td>
</tr>
<tr>
<td>SEND</td>
<td>SEND command parameters.</td>
</tr>
<tr>
<td>COMPUTATION</td>
<td>Options that affect computations.</td>
</tr>
<tr>
<td>MDI</td>
<td>MDI parameters.</td>
</tr>
<tr>
<td>EXTERNALSORT</td>
<td>External sort parameters.</td>
</tr>
<tr>
<td>FOCCalc</td>
<td>FOCCalc environmental parameters.</td>
</tr>
<tr>
<td>ENVIRONMENT</td>
<td>General working environment options.</td>
</tr>
<tr>
<td>WEBFOCUS</td>
<td>WEBFOCUS environmental parameters.</td>
</tr>
<tr>
<td>REPORT</td>
<td>Options that affect report appearance.</td>
</tr>
<tr>
<td>GRAPH</td>
<td>Classical GRAPH control parameters.</td>
</tr>
<tr>
<td>STYLESHEET</td>
<td>Options that affect STYLESHEET.</td>
</tr>
<tr>
<td>RETRIEVAL</td>
<td>Parameters that affect data retrieval.</td>
</tr>
<tr>
<td>HOLD</td>
<td>Options that affect HOLD output.</td>
</tr>
<tr>
<td>PLATFORM</td>
<td>Platform-dependent options.</td>
</tr>
<tr>
<td>MAINFRAME</td>
<td>Options relevant only to IBM/MAINFRAME.</td>
</tr>
<tr>
<td>MSWINDOWS</td>
<td>Options relevant only to MSWINDOWS</td>
</tr>
</tbody>
</table>
**Example:**  **Viewing Parameters by Functional Category**

To view the current values for parameters in all categories, enter:

```
? SET BY CATEGORY
```

This displays the existing parameter values in each category (first four of twenty shown).

```

Syntax:  **How to Display SET Parameter Values for a Specific Functional Area**

Issue the following commands in any supported profile, in a focexec, or at the command prompt, to display settable parameter values for a specified functional area:

```
? SET CATEGORY categoryname
```

where:

`categoryname`  
Is one of the categories.
New QUOTEP Option for Continental Decimal Notation

Syntax:  **How to Display the List of Categories**

Issue the following command in any supported profile, in a focexec, or at the command prompt, to display settable parameter values for a specified functional area:

```
? SET CATEGORY HELP
```

New QUOTEP Option for Continental Decimal Notation

**How to:**
Specify Continental Decimal Notation

**Example:**
Setting CDN Numeric Notation to Apostrophes and Periods

**Reference:**
Usage Notes for Continental Decimal Notation

You can use the SET CDN command to specify the characters used as decimal and thousands separators for numbers displayed on report output.

**Syntax:**  **How to Specify Continental Decimal Notation**

```
SET CDN = option
ON TABLE SET CDN option
```

where:

**option**
Can be one of the following:

**OFF**
Turns CDN off. For example, the number 3,045,000.76 is represented as 3,045,000.76. OFF should be used for the USA, Canada, Mexico, and the United Kingdom. OFF is the default (standard) value.

**ON**
Designates the decimal separator as a comma and the thousands separator as a period. For example, the number 3,045,000.76 is represented as 3.045.000,76. ON should be used for Germany, Denmark, Italy, Spain, and Brazil.

**SPACE**
Sets the decimal point as a comma, and the thousands separator as a space. For example, the number 3,045,000.76 is represented as 3 045 000,76. SPACE should be used for France, Norway, Sweden, and Finland.
QUOTE
Sets the decimal point as a comma and the thousands separator as an apostrophe. For example, the number 3,045,000.76 is represented as 3'045'000,76. QUOTE should be used for Switzerland.

QUOTEP
Sets the decimal point as a period and the thousands separator as an apostrophe. For example, the number 3,045,000.76 is represented as 3'045'000.76.

Reference: Usage Notes for Continental Decimal Notation
If the display format of a report is Excel 2000 or later, Continental Decimal Notation is controlled by the settings on the user's computer. That is, numbers in report output are formatted according to the convention of the locale (location) set in regional or browser language options.

Example: Setting CDN Numeric Notation to Apostrophes and Periods

```
SET CDN=QUOTEP
TABLE FILE EMPLOYEE
PRINT FIRST_NAME LAST_NAME SALARY
END
```

The output is:

<table>
<thead>
<tr>
<th>FIRST_NAME</th>
<th>LAST_NAME</th>
<th>SALARY</th>
</tr>
</thead>

</tbody>
</table>
Establishing a Default Value for the &ECHO Variable

How to:
Set a Default Value for &ECHO

Example:
Setting a Default Value for the &ECHO Variable

The Dialogue Manager variable &ECHO controls whether commands are displayed as they execute.

By default, &ECHO is set to OFF in every procedure in an application, which means that commands are not displayed as they execute. You can change this value for a specific procedure by specifying a value on the EX command, in a -SET command, or in a -DEFAULT command.

Even if a calling procedure is executed with &ECHO=ALL, any called procedure that does not explicitly set the value of &ECHO is executed using the default value of OFF.

The SET DEFECHO command enables you to specify a default value for &ECHO that spans all procedures executed in an application or session. Any FOCEXEC executed that does not explicitly establish a value for &ECHO uses the default value established by the SET DEFECHO command. You can explicitly control the value of &ECHO for an individual procedure by either passing a value on the EX command, issuing a -SET command for &ECHO, or issuing a -DEFAULT command for &ECHO.

Syntax: How to Set a Default Value for &ECHO

```
SET DEFECHO = {OFF | ON | ALL}
```

where:

**OFF**

Establishes OFF as the default value for &ECHO. OFF is the default value.

**ON**

Establishes ON as the default value for &ECHO. ON displays FOCUS commands that are expanded and stacked for execution.

**ALL**

Establishes ALL as the default value for &ECHO. ALL displays Dialogue Manager commands and FOCUS commands that are expanded and stacked for execution.
Example: **Setting a Default Value for the &ECHO Variable**

The following procedure executes two FOCEXECs. The first FOCEXEC, `RJUST1`, right justifies the last name of employees in the EMPLOYEE data source, and the second FOCEXEC, `CTRFLD1`, centers the names. The first EX command sets &ECHO to ON:

```
EX RJUST1 ECHO=ON
EX CTRFLD1
```

The RJUST1 procedure is echoed before the report output is generated. The CTRFLD1 procedure uses the default value, OFF, for &ECHO, so the procedure is not echoed.

**Echo for RJUST1:**

```
TABLE FILE EMPLOYEE
PRINT LAST_NAME AND COMPUTE
RIGHT_NAME/A15 = RJUST(15, LAST_NAME, RIGHT_NAME);
WHERE DEPARTMENT EQ 'MIS';
END
```

**Report output for RJUST1:**

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>RIGHT_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMITH</td>
<td>SMITH</td>
</tr>
<tr>
<td>JONES</td>
<td>JONES</td>
</tr>
<tr>
<td>MCCOY</td>
<td>MCCOY</td>
</tr>
<tr>
<td>BLACKWOOD</td>
<td>BLACKWOOD</td>
</tr>
<tr>
<td>GREENSPAN</td>
<td>GREENSPAN</td>
</tr>
<tr>
<td>CROSS</td>
<td>CROSS</td>
</tr>
</tbody>
</table>

**Report output for CTRFLD1:**

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>CENTER_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMITH</td>
<td>SMITH</td>
</tr>
<tr>
<td>JONES</td>
<td>JONES</td>
</tr>
<tr>
<td>MCCOY</td>
<td>MCCOY</td>
</tr>
<tr>
<td>BLACKWOOD</td>
<td>BLACKWOOD</td>
</tr>
<tr>
<td>GREENSPAN</td>
<td>GREENSPAN</td>
</tr>
<tr>
<td>CROSS</td>
<td>CROSS</td>
</tr>
</tbody>
</table>
Establishing a Default Value for the &ECHO Variable

Running the procedure with SET DEFECHO=ON, but specifying ECHO=OFF on the EX command for RJUST1, causes the CTRFLD1 procedure to use the default of ON. However, the RJUST1 procedure uses the specified value of OFF:

```
SET DEFECHO = ON
EX RJUST1 ECHO=OFF
EX CTRFLD1
```

Report output for RJUST1:

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>RIGHT_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMITH</td>
<td>SMITH</td>
</tr>
<tr>
<td>JONES</td>
<td>JONES</td>
</tr>
<tr>
<td>MCCOY</td>
<td>MCCOY</td>
</tr>
<tr>
<td>BLACKWOOD</td>
<td>BLACKWOOD</td>
</tr>
<tr>
<td>GREENSPAN</td>
<td>GREENSPAN</td>
</tr>
<tr>
<td>CROSS</td>
<td>CROSS</td>
</tr>
</tbody>
</table>

Echo for CTRFLD1:

```
TABLE FILE EMPLOYEE
PRINT LAST_NAME AND COMPUTE
CENTER_NAME/A12 = CTRFLD(LAST_NAME, 12, 'A12');
WHERE DEPARTMENT EQ 'MIS'
END
```

Report output for CTRFLD1:

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>CENTER_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMITH</td>
<td>SMITH</td>
</tr>
<tr>
<td>JONES</td>
<td>JONES</td>
</tr>
<tr>
<td>MCCOY</td>
<td>MCCOY</td>
</tr>
<tr>
<td>BLACKWOOD</td>
<td>BLACKWOOD</td>
</tr>
<tr>
<td>GREENSPAN</td>
<td>GREENSPAN</td>
</tr>
<tr>
<td>CROSS</td>
<td>CROSS</td>
</tr>
</tbody>
</table>
Retrieving the Site Code of the Connected User

How to:
Retrieve the Site Code

Example:
Querying the Site Code

The FOCUS site code is installed as part of the License Management facility.

Once the site code has been installed, you can retrieve its value by issuing the ? SITECODE query command. If the site code has not been installed, you will get a message indicating that the site code is not available.

Syntax:   How to Retrieve the Site Code

? SITECODE

Example: Querying the Site Code

Assume you installed the License Management facility with site code A52709b. Issue the following query command:

? SITECODE

The output is:

SITE CODE A52709b

If the site code is not installed, the ? SITECODE query returns the following message:

SITE CODE NOT AVAILABLE
Establishing a Non-Overridable User Password

How to:
Set a Non-Overridable User Password

Reference:
Usage Notes for Non-Overridable User Passwords

Example:
Setting a Non-Overridable User Password

The PERMPASS parameter establishes a user password that remains in effect throughout a session or connection. You can issue this setting in any supported profile but is most useful when established for an individual user by setting it in a user profile. It cannot be set in an ON TABLE phrase. It is recommended that it not be set in FOCPARM or FOCPROF because it would then apply to all users. In a FOCUS session, SET PERMPASS can be issued in PROFILE, a FOCEXEC, or at the command prompt.

All security rules established in the DBA sections of existing Master Files are respected when PERMPASS is in effect. The user cannot issue the SET PASS or SET USER command to change to a user password with different security rules. Any attempt to do so generates the following message:

permanent PASS is in effect. Your PASS will not be honored.
VALUE WAS NOT CHANGED

Only one permanent password can be established in a session. Once it is set, it cannot be changed within the session.

Syntax: How to Set a Non-Overridable User Password

SET PERMPASS=userpass
where:

userpass

Is the user password used for all access to data sources with DBA security rules established in their associated Master Files.
Example: Setting a Non-Overridable User Password

Consider the MOVIES Master File with the following DBA rules in effect:

```
DBA=USER1,$
USER = USERR,  ACCESS = R ,$
USER = USERU,  ACCESS = U ,$
USER = USERW,  ACCESS = W ,$
USER = USERRW, ACCESS = RW,$
```

The following FOCEXEC sets a permanent password:

```
SET PERMPASS = USERU
TABLE FILE MOVIES
PRINT TITLE BY DIRECTOR
END
```

The user has ACCESS=U and, therefore, is not allowed to issue a table request against the file:

```
(FOC047) THE USER DOES NOT HAVE SUFFICIENT ACCESS RIGHTS TO THE FILE:
CAR
BYPASSING TO END OF COMMAND
```

The permanent password cannot be changed:

```
SET PERMPASS = USERRW
```

permanent PASS is in effect. Your PASS will not be honored.
VALUE WAS NOT CHANGED

The user password cannot be changed:

```
SET PASS = USERRW
```

permanent PASS is in effect. Your PASS will not be honored.
VALUE WAS NOT CHANGED

Reference: Usage Notes for Non-Overridable User Passwords

If you use FOCUSID to set passwords externally, these external passwords may be overridable or non-overridable. If they are non-overridable, they take precedence over the PERMPASS setting.

```
SET PERMPASS is supported in MSO. The profiles available in order of precedence are:
```

- Member PROFILE in the data set allocated to ddname MSOPROF. This profile is executed for all users.
- Members with users’ user IDs as names in the data set allocated to ddname MSOPROF. The profile is executed for the user corresponding to the user ID.
Creating a Standard Quote-Delimited String

- Member PROFILE in the data set allocated by a user to ddname FOCEXEC. This profile is executed for that specific user and is a standard FOCUS profile.

- Member SHELPROF in the data set allocated to ddname FOCEXEC in the MSO startup JCL. This profile is executed for all users and is a standard FOCUS profile.

Creating a Standard Quote-Delimited String

**How to:**
Create a Standard Quote-Delimited Character String

**Reference:**
Usage Notes for Quote-Delimited Character Strings

**Example:**
Creating a Standard Quote-Delimited Character String
Converting User Input to a Standard Quote-Delimited Character String
Using Quote-Delimited Strings With Relational Data Adapters

Character strings must be enclosed in single quotation marks to be handled by most database engines. In addition, embedded single quotation marks are indicated by two contiguous single quotation marks. FOCUS, WebFOCUS, and iWay require quotes around variables containing delimiters, which include spaces and commas.

The QUOTEDSTRING suffix on a Dialogue Manager variable applies the following two conversions to the contents of the variable:

- Any single quotation mark embedded within a string is converted to two single quotation marks.
- Single quotation marks are added around the string.

Dialogue Manager commands differ in their ability to handle character strings that are not enclosed in single quotation marks and contain embedded blanks. An explicit or implied -PROMPT command can read such a string. The entire input string is then enclosed in single quotation marks when operated on by .QUOTEDSTRING.

**Note:** When using the -SET command to reference a character string, ensure the character string is enclosed in single quotes to prevent errors.
Syntax:  How to Create a Standard Quote-Delimited Character String

&var.QUOTEDSTRING

where:

&var

Is a Dialogue Manager variable.

Example:  Creating a Standard Quote-Delimited Character String

The following example shows the results of the QUOTEDSTRING suffix on input strings.

-SET &A = ABC;
-SET &B = 'ABC';
-SET &C = O'BRIEN;
-SET &D = 'O'BRIEN';
-SET &E = 'O''BRIEN';
-SET &F = O''BRIEN;
-SET &G = OBRIEN';
-TYPE ORIGINAL = &A QUOTED = &A.QUOTEDSTRING
-TYPE ORIGINAL = &B QUOTED = &B.QUOTEDSTRING
-TYPE ORIGINAL = &C QUOTED = &C.QUOTEDSTRING
-TYPE ORIGINAL = &D QUOTED = &D.QUOTEDSTRING
-TYPE ORIGINAL = &E QUOTED = &E.QUOTEDSTRING
-TYPE ORIGINAL = &F QUOTED = &F.QUOTEDSTRING
-TYPE ORIGINAL = &G QUOTED = &G.QUOTEDSTRING

The output is:

ORIGINAL = ABC        QUOTED = 'ABC'
ORIGINAL = ABC        QUOTED = 'ABC'
ORIGINAL = O'BRIEN    QUOTED = 'O''BRIEN'
ORIGINAL = O'BRIEN    QUOTED = 'O''BRIEN'
ORIGINAL = O'BRIEN    QUOTED = 'O''BRIEN'
ORIGINAL = O'BRIEN    QUOTED = 'O''BRIEN'
ORIGINAL = OBRIEN'    QUOTED = 'OBRIEN'''

Note: The -SET command will remove single quotes around a string. Notice in the example above that the result of -SET &B = 'ABC' was changed to ORIGINAL = ABC (as shown in the output), prior to the QUOTEDSTRING conversion.
Creating a Standard Quote-Delimited String

Example: Converting User Input to a Standard Quote-Delimited Character String

The following -TYPE command accepts quoted or unquoted input and displays quoted output.

```
-TYPE THE QUOTED VALUE IS: &E.QUOTEDSTRING
```

The output is:

```
PLEASE SUPPLY VALUES REQUESTED
```

```
E=
O'BRIEN
THE QUOTED VALUE IS: 'O'BRIEN'
```

Example: Using Quote-Delimited Strings With Relational Data Adapters

The following procedure creates an Oracle table named SQLVID from the VIDEOTRK data source.

```
TABLE FILE VIDEOTRK
SUM CUSTID EXPDATE PHONE STREET CITY STATE ZIP
   TRANSDATE PRODCODE TRANSCODE QUANTITY TRANSTOT
BY LASTNAME BY FIRSTNAME
WHERE LASTNAME NE 'NON-MEMBER'
ON TABLE HOLD
END
-RUN
CREATE FILE SQLVID
-RUN
MODIFY FILE SQLVID
FIXFORM FROM HOLD
DATA ON HOLD
END
```

Consider the following SQL Translator request:

```
SET TRACEUSER = ON
SET TRACEMON = STMTRACE//CLIENT
SQL
SELECT *
FROM SQLVID WHERE LASTNAME = &1.QUOTEDSTRING;
END
```

When this request is executed, you must enter a last name, in this case O'BRIEN:

```
PLEASE SUPPLY VALUES REQUESTED
```

```
1=
O'BRIEN
```
In the generated SQL request, the character string used for the comparison is correctly enclosed in single quotation marks, and the embedded single quote is doubled:

```sql
SELECT SQLCOR01.CIN , SQLCOR01.LN , SQLCOR01.FN ,
       SQLCOR01.EXDAT , SQLCOR01.TEL , SQLCOR01.STR , SQLCOR01.CITY ,
       SQLCOR01.PROV , SQLCOR01.POSTAL_CODE , SQLCOR01.OUTDATE ,
       SQLCOR01.PCOD , SQLCOR01.TCOD , SQLCOR01.NO , SQLCOR01.TTOT
FROM SQLVID SQLCOR01  WHERE SQLCOR01.LN  = 'O''BRIEN';
```

The output is:

```
CIN   LN               FN     ...
---   --               --     ...
5564  O'BRIEN          DONALD ...
```

The following input variations are translated to the correct form of quoted string demonstrated in the trace.

- `'O'BRIEN'
- `'O''BRIEN'

Any other variation results in:

- A valid string that does not match the database value and does not return any rows. For example, O''''BRIEN becomes 'O''''''''BRIEN' in the WHERE predicate.
- An invalid string that produces one of the following messages:
  - Error - Semi-colon or END expected
  - Error - Missing or Misplaced quotes
  - Error - (value entered) is not a valid column
  - Error - Syntax error on line ... Unbalanced quotes

Strings without embedded single quotation marks can be entered without quotes or embedded in single quotation marks, either SMITH or 'SMITH'.

If you use `&1` without the QUOTEDSTRING suffix in the request, acceptable input strings that retrieve O'Brien's record are:

- '''O''''BRIEN'''
- '''O''''BRIEN'''

Using `&1` without the QUOTEDSTRING suffix, the acceptable form of a string without embedded single quotation marks is '''SMITH'''.

---

**Summary of New Features**

185
To make a string enclosed in single quotation marks acceptable without the QUOTEDSTRING suffix, use '&1' in the request. In this case, in order to retrieve O'Brien's record, you must enter the string that would have resulted from the QUOTEDSTRING suffix:

'O''''BRIEN'

To enter a string without embedded single quotation marks using '&1', you can either omit the surrounding single quotation marks or include them: SMITH or 'SMITH'.

**Note:** The form '&1.QUOTEDSTRING' is not supported.

**Reference: Usage Notes for Quote-Delimited Character Strings**

- An unmatched single quotation mark at the beginning of a character string is treated as invalid input and generates the following message:

  (FOC257) MISSING QUOTE MARKS: value;

**Assignment Between Text Fields and Alphanumeric Fields**

**How to:**

Assign a Value to a Text Field or Assign a Text Field to a Text or Alphanumeric Field

**Reference:**

Usage Notes for Text Fields in COMPUTE and DEFINE

**Example:**

Assigning the Result of an Alphanumeric Expression to a Text Field

Both text and alphanumeric fields can be assigned values stored in text fields or alphanumeric expressions in TABLE COMPUTE, MODIFY COMPUTE, and DEFINE commands. If an alphanumeric field is assigned the value of a text field that is too long for the alphanumeric field, the value is truncated before being assigned to the alphanumeric field.
**Syntax:** How to Assign a Value to a Text Field or Assign a Text Field to a Text or Alphanumeric Field

In a DEFINE FILE command, use the following syntax

```
DEFINE
    field/{TXn|An} = {alphaexpression|textfield};
END
```

In a TABLE COMPUTE or MODIFY COMPUTE command, use the following syntax

```
COMPUTE field/{TXn|An} = {alphaexpression|textfield};
```

where:

- **field**
  - Is a text or alphanumeric field that will receive the text field value or result of the alphanumeric expression.

- **n**
  - Is the length of the alphanumeric field or the output display length of the text field that will receive the value from the right hand side of the COMPUTE or DEFINE command.

- **alphaexpression**
  - Is the name of an alphanumeric field, an alphanumeric literal, or an alphanumeric expression.

- **textfield**
  - Is the name of a text field.
**Example:**  **Assigning the Result of an Alphanumeric Expression to a Text Field**

This example uses the COURSES data source, which contains a text field, to create an alphanumeric field named ADESC, which truncates the text field at 36 characters, and a new text field named NEWDESC, which is a text version of ADESC:

```plaintext
DEFINE FILE COURSES
ADESC/A36   = DESCRIPTION;
NEWDESC/TX36 = ADESC;
END

TABLE FILE COURSES
PRINT ADESC NEWDESC
END
```

The output is:

<table>
<thead>
<tr>
<th>ADESC</th>
<th>NEWDESC</th>
</tr>
</thead>
<tbody>
<tr>
<td>This course provides the DP professi</td>
<td>This course provides the DP professi</td>
</tr>
<tr>
<td>Anyone responsible for designing FOC</td>
<td>Anyone responsible for designing FOC</td>
</tr>
<tr>
<td>This is a course in FOCUS efficiency</td>
<td>This is a course in FOCUS efficiency</td>
</tr>
</tbody>
</table>

**Reference: Usage Notes for Text Fields in COMPUTE and DEFINE**

COMPUTE commands in Maintain do not support text fields.
DATETRAN Function

**How to:**
Format Dates in International Formats

**Reference:**
Usage Notes for the DATETRAN Function

**Example:**
Using the DATETRAN Function

The DATETRAN function formats dates in international formats.

**Syntax:**

**How to Format Dates in International Formats**

```
DATETRAN (indate, '(intype)', '([formatops])', 'lang', outlen, output)
```

where:

- `indate`
  Is the input date (in date format) to be formatted. Note that the date format cannot be an alphanumeric or numeric format with date display options (legacy date format).

- `intype`
  Is one of the following character strings indicating the input date components and the order in which you want them to display, enclosed in parentheses and single quotation marks:

<table>
<thead>
<tr>
<th>Single Component Input Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'(W)'</td>
<td>Day of week component only (original format must have only W component).</td>
</tr>
<tr>
<td>'(M)'</td>
<td>Month component only (original format must have only M component).</td>
</tr>
</tbody>
</table>
**DATETRAN Function**

<table>
<thead>
<tr>
<th>Two-Component Input Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'(YYM)'</td>
<td>Four-digit year followed by month.</td>
</tr>
<tr>
<td>'(YM)'</td>
<td>Two-digit year followed by month.</td>
</tr>
<tr>
<td>'(MYY)'</td>
<td>Month component followed by four-digit year.</td>
</tr>
<tr>
<td>'(MY)'</td>
<td>Month component followed by two-digit year.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Three-Component Input Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'(YYMD)'</td>
<td>Four-digit year followed by month followed by day.</td>
</tr>
<tr>
<td>'(YMD)'</td>
<td>Two-digit year followed by month followed by day.</td>
</tr>
<tr>
<td>'(DMYY)'</td>
<td>Day component followed by month followed by four-digit year.</td>
</tr>
<tr>
<td>'(DMY)'</td>
<td>Day component followed by month followed by two-digit year.</td>
</tr>
<tr>
<td>'(MDYY)'</td>
<td>Month component followed by day followed by four-digit year.</td>
</tr>
<tr>
<td>'(MDY)'</td>
<td>Month component followed by day followed by two-digit year.</td>
</tr>
<tr>
<td>'(MD)'</td>
<td>Month component followed by day (derived from three-component date by ignoring year component).</td>
</tr>
<tr>
<td>'(DM)'</td>
<td>Day component followed by month (derived from three-component date by ignoring year component).</td>
</tr>
</tbody>
</table>

*formatops*

Is a string of zero or more formatting options enclosed in parentheses and single quotation marks. The parentheses and quotation marks are required even if you do not specify formatting options. Formatting options fall into the following categories:

- Options for suppressing initial zeros in month or day numbers.
- Options for translating month or day components to full or abbreviated uppercase or default case (mixed case or lowercase depending on the language) names.
- Date delimiter options and options for punctuating a date with commas.
Valid options for suppressing initial zeros in month or day numbers are:

<table>
<thead>
<tr>
<th>Format Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>m</td>
<td>Zero-suppresses months (displays numeric months before October as 1 through 9 rather than 01 through 09).</td>
</tr>
<tr>
<td>d</td>
<td>Displays days before the tenth of the month as 1 through 9 rather than 01 through 09.</td>
</tr>
<tr>
<td>dp</td>
<td>Displays days before the tenth of the month as 1 through 9 rather than 01 through 09 with a period after the number.</td>
</tr>
<tr>
<td>do</td>
<td>Displays days before the tenth of the month as 1 through 9. For English (langcode EN) only, displays an ordinal suffix (st, nd, rd, or th) after the number.</td>
</tr>
</tbody>
</table>

Valid month and day name translation options are:

<table>
<thead>
<tr>
<th>Format Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>T</td>
<td>Displays month as an abbreviated name with no punctuation, all uppercase.</td>
</tr>
<tr>
<td>TR</td>
<td>Displays month as a full name, all uppercase.</td>
</tr>
<tr>
<td>Tp</td>
<td>Displays month as an abbreviated name followed by a period, all uppercase.</td>
</tr>
<tr>
<td>t</td>
<td>Displays month as an abbreviated name with no punctuation. The name is all lowercase or initial uppercase, depending on language code.</td>
</tr>
<tr>
<td>tr</td>
<td>Displays month as a full name. The name is all lowercase or initial uppercase, depending on language code.</td>
</tr>
<tr>
<td>tp</td>
<td>Displays month as an abbreviated name followed by a period. The name displays in the default case of the specified language (for example, all lowercase for French and Spanish, initial uppercase for English and German).</td>
</tr>
<tr>
<td>W</td>
<td>Includes an abbreviated day of the week name at the start of the displayed date, all uppercase with no punctuation.</td>
</tr>
<tr>
<td>WR</td>
<td>Includes a full day of the week name at the start of the displayed date, all uppercase.</td>
</tr>
<tr>
<td>Format Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>wp</td>
<td>Includes an abbreviated day of the week name at the start of the displayed date, all uppercase, followed by a period.</td>
</tr>
<tr>
<td>w</td>
<td>Includes an abbreviated day of the week name at the start of the displayed date with no punctuation. The name displays in the default case of the specified language (for example, all lowercase for French and Spanish, initial uppercase for English and German).</td>
</tr>
<tr>
<td>wr</td>
<td>Includes a full day of the week name at the start of the displayed date. The name displays in the default case of the specified language (for example, all lowercase for French and Spanish, initial uppercase for English and German).</td>
</tr>
<tr>
<td>wp</td>
<td>Includes an abbreviated day of the week name at the start of the displayed date followed by a period. The name displays in the default case of the specified language (for example, all lowercase for French and Spanish, initial uppercase for English and German).</td>
</tr>
<tr>
<td>x</td>
<td>Includes an abbreviated day of the week name at the end of the displayed date, all uppercase with no punctuation.</td>
</tr>
<tr>
<td>XR</td>
<td>Includes a full day of the week name at the end of the displayed date, all uppercase.</td>
</tr>
<tr>
<td>xp</td>
<td>Includes an abbreviated day of the week name at the end of the displayed date, all uppercase, followed by a period.</td>
</tr>
<tr>
<td>x</td>
<td>Includes an abbreviated day of the week name at the end of the displayed date with no punctuation. The name displays in the default case of the specified language (for example, all lowercase for French and Spanish, initial uppercase for English and German).</td>
</tr>
<tr>
<td>xr</td>
<td>Includes a full day of the week name at the end of the displayed date. The name displays in the default case of the specified language (for example, all lowercase for French and Spanish, initial uppercase for English and German).</td>
</tr>
<tr>
<td>xp</td>
<td>Includes an abbreviated day of the week name at the end of the displayed date followed by a period. The name displays in the default case of the specified language (for example, all lowercase for French and Spanish, initial uppercase for English and German).</td>
</tr>
</tbody>
</table>
Valid date delimiter options are:

<table>
<thead>
<tr>
<th>Format Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>Uses a blank as the component delimiter. This is the default if the month or day of week is translated or if comma is used.</td>
</tr>
<tr>
<td>.</td>
<td>Uses a period as the component delimiter.</td>
</tr>
<tr>
<td>-</td>
<td>Uses a minus sign as the component delimiter. This is the default when the conditions for a blank default delimiter are not satisfied.</td>
</tr>
<tr>
<td>/</td>
<td>Uses a slash as the component delimiter.</td>
</tr>
<tr>
<td></td>
<td>Omits component delimiters.</td>
</tr>
<tr>
<td>K</td>
<td>Uses appropriate Asian characters as component delimiters.</td>
</tr>
<tr>
<td>c</td>
<td>Places a comma after the month name (following T, Tp, TR, t, tp, or tr). Places a comma and blank after the day name (following W, Wp, WR, w, wp, or wr). Places a comma and blank before the day name (following X, XR, x, or xr).</td>
</tr>
<tr>
<td>e</td>
<td>Displays the Spanish or Portuguese word de or DE between the day and month and between the month and year. The case of the word de is determined by the case of the month name. If the month is displayed in uppercase, DE is displayed; otherwise de is displayed. Useful for formats DMY, DMYY, MY, and MYY.</td>
</tr>
<tr>
<td>D</td>
<td>Inserts a comma after the day number and before the general delimiter character specified.</td>
</tr>
<tr>
<td>Y</td>
<td>Inserts a comma after the year and before the general delimiter character specified.</td>
</tr>
</tbody>
</table>
**DATETRAN Function**

**lang**
Is the two-character standard ISO code for the language into which the date should be translated, enclosed in single quotation marks. Valid language codes are:

- 'DE' German
- 'DU' Dutch
- 'EN' English
- 'ES' Spanish
- 'FR' French
- 'GR' Greek
- 'HE' Hebrew
- 'JA' Japanese
- 'NO' Norwegian (bokmål)
- 'PT' Portuguese
- 'SV' Swedish
- 'ZH' Simplified Chinese

**outlen**
**Numeric**
Is the length of the output field in bytes. If the length is insufficient, an all blank result is returned. If the length is greater than required, the field is padded with blanks on the right.

**output**
**Alphanumeric**
Is the name of the field that contains the translated date, or its format enclosed in single quotation marks.
Reference: Usage Notes for the DATETRAN Function

- The output field, though it must be type A and not AnV, may in fact contain variable length information, since the lengths of month names and day names can vary, and also month and day numbers may be either one or two bytes long if a zero-suppression option is chosen. Unused bytes are filled with blanks.

- All invalid and inconsistent inputs result in all blank output strings. Missing data also results in blank output.

- The base dates (1900-12-31 and 1900-12 or 1901-01) are treated as though the DATEDISPLAY setting were ON (that is, not automatically shown as blanks). To suppress the printing of base dates, which have an internal integer value of 0, test for 0 before calling DATETRAN. For example:

  ```
  RESULT/A40 = IF DATE EQ 0 THEN ' ' ELSE
  DATETRAN (DATE, '(YYMD)', '(d)', 'FR', 40, 'A40');
  ```

- Valid translated date components are contained in files named DTLNG<mg where<mg is a three-character code that specifies the language. These files must be accessible for each language into which you want to translate dates.

- If you use a terminal emulator program, it must be set to use a code page that can display the accent marks and characters in the translated dates. You may not be able to display dates translated into European and Asian characters at the same time. Similarly, if you want to print the translated dates, your printer must be capable of printing the required characters.

- The DATETRAN function is not supported in Dialogue Manager.
**Example: Using the DATETRAN Function**

The following request prints the day of the week in the default case of the specific language:

```plaintext
DEFINE FILE VIDEOTRK
TRANS1/YYMD=20050104;
TRANS2/YYMD=20051003;

DATEW/W=TRANS1 ;
DATEW2/W=TRANS2 ;
DATEYYMD/YYMDW=TRANS1 ;
DATEYYMD2/YYMDW=TRANS2 ;

OUT1A/A8=DATETRAN(DATEW, '(W)', 'EN', 8 , 'A8') ;
OUT1B/A8=DATETRAN(DATEW2, '(W)', 'EN', 8 , 'A8') ;
OUT1C/A8=DATETRAN(DATEW, '(W)', 'ES', 8 , 'A8') ;
OUT1D/A8=DATETRAN(DATEW2, '(W)', 'ES', 8 , 'A8') ;
OUT1E/A8=DATETRAN(DATEW, '(W)', 'FR', 8 , 'A8') ;

Extensions to Date-Time Formats

**How to:**
- Enable ISO Standard Date-Time Notation
- Specify Universal Time Format
- Specify the Character T as the Date-Time Separator

**Reference:**
Abbreviations for Component Name Argument for Date-Time Functions

**Example:**
- Specifying Date-Time Input Values
- Specifying an Abbreviated Component Name in a Date-Time Function

Date-time formats can produce output values and accept input values that are compatible with the ISO 8601:2000 date-time notation standard. A SET parameter and additional formatting options have been added to enable this notation. In addition, abbreviations are supported for date-time components used as arguments to date-time functions.
Syntax: **How to Enable ISO Standard Date-Time Notation**

\[
\text{SET DTSTANDARD} = \{\text{OFF}|\text{ON}|\text{STANDARD}|\text{STANDARDU}\}
\]

where:

**OFF**

Does not provide compatibility with the ISO 8601:2000 date-time notation standard. OFF is the default value.

**ON|STANDARD**

Enables recognition and output of the ISO standard formats, including use of T as the delimiter between date and time, use of period or comma as the delimiter of fractional seconds, use of Z at the end of “universal” times, and acceptance of inputs with time zone information. STANDARD is a synonym for ON.

**STANDARDU**

Enables ISO standard formats (like STANDARD) and also, where possible, converts input strings to the equivalent "universal" time (formerly known as "Greenwich Mean Time"), thus enabling applications to store all date-time values in a consistent way.

Syntax: **How to Specify Universal Time Format**

\[
H\text{time}Z
\]

where:

**time**

Is a format option for the time components. For example HHI specifies a time component consisting of a two-digit hour and a two-digit minute.

**Z**

Indicates universal time. Z is incompatible with AM/PM output. It prints Z at the end of the output string to indicate a universal time.
**Syntax:**  **How to Specify the Character T as the Date-Time Separator**

With the STANDARD and STANDARDU settings, the separator for dates is always a hyphen.

The separator between date and time is blank by default. However, if you specify the following separator option, the date and time are separated by the character T:

`H[date][U][time][Z]`

where:

- **date**
  - Is a format option for the date components. For example, HYYMD specifies a date component consisting of a four-digit year, a two-digit month, and a two-digit day.

- **U**
  - Is the date separator option that displays the character T between the date and time. U is incompatible with AM/PM output.

- **time**
  - Is a format option for the time components. For example, I specifies a time component consisting of a two-digit hour and a two-digit minute.

- **Z**
  - Indicates universal time.

**Example:  Specifying Date-Time Input Values**

With DTSTANDARD settings of STANDARD and STANDARDU, the following time formats can be read as input:

<table>
<thead>
<tr>
<th>Input Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>14:30[:20,99]</code></td>
<td>Comma separates time components instead of period.</td>
</tr>
<tr>
<td><code>14:30[:20.99]Z</code></td>
<td>Universal time.</td>
</tr>
<tr>
<td><code>15:30[:20,99]+01</code></td>
<td>Each of these is the same as above in Central European Time.</td>
</tr>
<tr>
<td><code>15:30[:20,99]+0100</code></td>
<td></td>
</tr>
<tr>
<td><code>15:30[:20,99]+01:00</code></td>
<td></td>
</tr>
<tr>
<td><code>09:30[:20.99]-05</code></td>
<td>Same as above in Eastern Standard Time.</td>
</tr>
</tbody>
</table>

Note that these values are stored identically internally with the STANDARDU setting. With the STANDARD setting, everything following the Z, +, or - is ignored.
Reference: Abbreviations for Component Name Argument for Date-Time Functions

The following component names and abbreviations are supported when calling a date-time function. Note that the component names and abbreviations can be entered in uppercase or lowercase:

<table>
<thead>
<tr>
<th>Component Name</th>
<th>Abbreviation</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>year</td>
<td>yy</td>
<td>0001-9999</td>
</tr>
<tr>
<td>quarter</td>
<td>qq</td>
<td>1-4</td>
</tr>
<tr>
<td>month</td>
<td>mm</td>
<td>1-12</td>
</tr>
<tr>
<td>day-of-year</td>
<td>dy</td>
<td>1-366</td>
</tr>
<tr>
<td>day or day-of-month</td>
<td>dd</td>
<td>1-31</td>
</tr>
<tr>
<td>week</td>
<td>wk</td>
<td>1-53</td>
</tr>
<tr>
<td>weekday</td>
<td>dw</td>
<td>1-7 (Sunday-Saturday)</td>
</tr>
<tr>
<td>hour</td>
<td>hh</td>
<td>0-23</td>
</tr>
<tr>
<td>minute</td>
<td>mi</td>
<td>0-59</td>
</tr>
<tr>
<td>second</td>
<td>ss</td>
<td>0-59</td>
</tr>
<tr>
<td>millisecond</td>
<td>ms</td>
<td>0-999</td>
</tr>
<tr>
<td>microsecond</td>
<td>mc</td>
<td>0-999999</td>
</tr>
</tbody>
</table>
**Example: Specifying an Abbreviated Component Name in a Date-Time Function**

The following request finds the number of days between the ADD_MONTH and TRANSDATE fields. The month component in the call to the HADD function is abbreviated as mm. The day component in the call to the HDIFF function is abbreviated as DD.

Standard universal date output is specified with the Z option in the ADD_MONTH format. The U separator option displays the date and time separated by the character T:

```plaintext
SET DTSTANDARD = STANDARD
TABLE FILE VIDEOTR2
PRINT CUSTID TRANSDATE AS 'DATE-TIME' AND COMPUTE
ADD_MONTH/HYYMDUSZ = HADD(TRANSDATE, 'mm', 2, 8, 'HYYMDUSZ');
DIFF_DAYS/D12.2 = HDIFF(ADD_MONTH, TRANSDATE, 'DD', 'D12.2');
WHERE DATE EQ 2000
END
```

The output is:

<table>
<thead>
<tr>
<th>CUSTID</th>
<th>DATE-TIME</th>
<th>ADD_MONTH</th>
<th>DIFF_DAYS</th>
</tr>
</thead>
<tbody>
<tr>
<td>1118</td>
<td>2000/06/26 05:45</td>
<td>2000-08-26T05:45:00Z</td>
<td>61.00</td>
</tr>
<tr>
<td>1237</td>
<td>2000/02/05 03:30</td>
<td>2000-04-05T03:30:00Z</td>
<td>60.00</td>
</tr>
</tbody>
</table>

**MIRR Function**

**How to:**

Calculate the Modified Internal Rate of Return

**Reference:**

Usage Notes for the MIRR Function

**Example:**

Calculating the Modified Internal Rate of Return

The MIRR function calculates the modified internal rate of return for a series of periodic cash flows.
**MIRR Function**

**Syntax:** How to Calculate the Modified Internal Rate of Return

```plaintext
TABLE FILE ...
{PRINT|SUM} field ...
COMPUTE rrate/fmt = MIRR(cashflow, finrate, reinvrate, output);
WITHIN {sort_field|TABLE}

where:

field ...
Are fields that appear in the report output.

rrate
Is the field that contains the calculated return rate.

fmt
Is the format of the return rate. The data type must be D.

cashflow
Is a numeric field. Each value represents either a payment (negative value) or income (positive value) for one period. The values must be in the correct sequence in order for the sequence of cash flows to be calculated correctly. The dates corresponding to each cash flow should be equally spaced and sorted in chronological order. The calculation requires at least one negative value and one positive value in the cashflow field. If the values are all positive or all negative, a zero result is returned.

finrate
Is a finance rate for negative cash flows. This value must be expressed as a non-negative decimal fraction between 0 and 1. It must be constant within each sort group for which a return rate is calculated, but it can change between sort groups.

reinvrate
Is the reinvestment rate for positive cash flows. This value must be expressed as a non-negative decimal fraction between 0 and 1. It must be constant within each sort group but can change between sort groups. It must be constant within each sort group for which a return rate is calculated, but it can change between sort groups.

output
Is the name of the field that contains the return rate, or its format enclosed in single quotation marks.

sort_field
Is a field that sorts the report output and groups it into subsets of rows on which the function can be calculated separately. To calculate the function using every row of the report output, use the WITHIN TABLE phrase. A WITHIN phrase is required.
Reference: Usage Notes for the MIRR Function

- This function is only supported in a COMPUTE command with the WITHIN phrase.
- The cash flow field must contain at least one negative value and one positive value.
- Dates must be equally spaced.
- Missing cash flows or dates are not supported.

Example: Calculating the Modified Internal Rate of Return

The following request calculates modified internal return rates for categories of products. It assumes a finance charge of ten percent and a reinvestment rate of ten percent. The request is sorted by date so that the correct cash flows are calculated. The rate returned by the function is multiplied by 100 in order to express it as a percent rather than a decimal value. Note that the format includes the % character. This causes a percent symbol to display, but it does not calculate a percent.

In order to create one cash flow value per date, the values are summed. NEWDOLL is defined in order to create negative values in each category as required by the function:

```plaintext
DEFINE FILE GGSALES
  SDATE/YYM = DATE;
  SYEAR/Y = SDATE;
  NEWDOLL/D12.2 = IF DATE LT '19970401' THEN -1 * DOLLARS ELSE DOLLARS;
END

TABLE FILE GGSALES
  SUM NEWDOLL
  COMPUTE RRATE/D7.2% = MIRR(NEWDOLL, .1, .1, RRATE) * 100;
  WITHIN CATEGORY
    BY CATEGORY
    BY SDATE
    WHERE SYEAR EQ 97
END
```
A separate rate is calculated for each category because of the WITHIN CATEGORY phrase. A portion of the output is shown:

<table>
<thead>
<tr>
<th>Category</th>
<th>SDATE</th>
<th>NEWDOLL</th>
<th>RRATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coffee</td>
<td>1997/01</td>
<td>-801,123.00</td>
<td>15.11%</td>
</tr>
<tr>
<td></td>
<td>1997/02</td>
<td>-682,340.00</td>
<td>15.11%</td>
</tr>
<tr>
<td></td>
<td>1997/03</td>
<td>-765,078.00</td>
<td>15.11%</td>

</tr>
<tr>
<td></td>
<td>1997/05</td>
<td>720,444.00</td>
<td>15.11%</td>
</tr>
<tr>
<td></td>
<td>1997/06</td>
<td>742,457.00</td>
<td>15.11%</td>
</tr>
<tr>
<td></td>
<td>1997/07</td>
<td>747,253.00</td>
<td>15.11%</td>
</tr>
<tr>
<td></td>
<td>1997/08</td>
<td>655,896.00</td>
<td>15.11%</td>
</tr>
<tr>
<td></td>
<td>1997/09</td>
<td>730,317.00</td>
<td>15.11%</td>
</tr>
<tr>
<td></td>
<td>1997/10</td>
<td>724,412.00</td>
<td>15.11%</td>
</tr>
<tr>
<td></td>
<td>1997/11</td>
<td>620,264.00</td>
<td>15.11%</td>
</tr>
<tr>
<td></td>
<td>1997/12</td>
<td>762,328.00</td>
<td>15.11%</td>
</tr>
<tr>
<td>Food</td>
<td>1997/01</td>
<td>-672,727.00</td>
<td>16.24%</td>
</tr>
<tr>
<td></td>
<td>1997/02</td>
<td>-699,073.00</td>
<td>16.24%</td>
</tr>
<tr>
<td></td>
<td>1997/03</td>
<td>-642,802.00</td>
<td>16.24%</td>
</tr>
<tr>
<td></td>
<td>1997/04</td>
<td>718,514.00</td>
<td>16.24%</td>
</tr>
<tr>
<td></td>
<td>1997/05</td>
<td>660,740.00</td>
<td>16.24%</td>
</tr>
<tr>
<td></td>
<td>1997/06</td>
<td>734,705.00</td>
<td>16.24%</td>
</tr>
<tr>
<td></td>
<td>1997/07</td>
<td>760,586.00</td>
<td>16.24%</td>
</tr>
</tbody>
</table>

To calculate one modified internal return rate for all of the report data, use the WITHIN TABLE phrase. In this case, the data does not have to be sorted by CATEGORY:

```
DEFINE FILE GGSALES
 SDATE/YYM = DATE;
 SYEAR/Y = SDATE;
 NEWDOLL/D12.2 = IF DATE LT '19970401' THEN -1 * DOLLARS ELSE DOLLARS;
END

TABLE FILE GGSALES
 SUM NEWDOLL
 COMPUTE RRATE/D7.2% = MIRR(NEWDOLL, .1, .1, RRATE) * 100;
 WITHIN TABLE
 BY SDATE
 WHERE SYEAR EQ 97
END
```
The output is:

<table>
<thead>
<tr>
<th>SDATE</th>
<th>NEWDOLL</th>
<th>RRATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1997/01</td>
<td>-1,864,129.00</td>
<td>15.92%</td>
</tr>
<tr>
<td>1997/02</td>
<td>-1,861,639.00</td>
<td>15.92%</td>
</tr>
<tr>
<td>1997/03</td>
<td>-1,874,439.00</td>
<td>15.92%</td>
</tr>
<tr>
<td>1997/04</td>
<td>1,829,838.00</td>
<td>15.92%</td>
</tr>
<tr>
<td>1997/05</td>
<td>1,899,494.00</td>
<td>15.92%</td>
</tr>
<tr>
<td>1997/06</td>
<td>1,932,630.00</td>
<td>15.92%</td>
</tr>

**XIRR Function**

**How to:**

Calculate the Internal Rate of Return

**Reference:**

Usage Notes for the XIRR Function

**Example:**

Calculating the Internal Rate of Return

The XIRR function calculates the internal rate of return for a series of cash flows that can be periodic or non-periodic.

**Syntax:**

**How to Calculate the Internal Rate of Return**

TABLE FILE ...
{PRINT|SUM} field ...
COMPUTE rrate/fmt = XIRR (cashflow, dates, guess, maxiterations, output); WITHIN {sort_field|TABLE}

where:

field ...

Are fields that appear in the report output.

rrate

Is the field that contains the calculated return rate.
**XIRR Function**

- **fmt**
  Is the format of the return rate. The data type must be D.

- **cashflow**
  Is a numeric field. Each value of this field represents either a payment (negative value) or income (positive value) for one period. The values must be in the correct sequence in order for the sequence of cash flows to be calculated correctly. The dates corresponding to each cash flow should be equally spaced and sorted in chronological order. The calculation requires at least one negative value and one positive value in the `cashflow` field. If the values are all positive or all negative, a zero result is returned.

- **dates**
  Is a date field containing the cash flow dates. The dates must be full component dates with year, month, and day components. Dates cannot be stored in fields with format A, I, or P. They must be stored in date fields (for example, format YMD, not AYMD). There must be the same number of dates as there are cash flow values. The number of dates must be the same as the number of cash flows.

- **guess**
  Is an (optional) initial estimate of the expected return rate expressed as a decimal. The default value is .1 (10%). To accept the default, supply the value 0 (zero) for this argument.

- **maxiterations**
  Is an (optional) number specifying the maximum number of iterations that can be used to resolve the rate using Newton’s method. 50 is the default value. To accept the default, supply the value 0 (zero) for this argument. The rate is considered to be resolved when successive iterations do not differ by more than 0.0000003. If this level of accuracy is achieved within the maximum number of iterations, calculation stops at that point. If it is not achieved after reaching the maximum number of iterations, calculation stops and the value calculated by the last iteration is returned.

- **output**
  D
  Is the name of the field that contains the return rate, or its format enclosed in single quotation marks.

- **sort_field**
  Is a field that sorts the report output and groups it into subsets of rows on which the function can be calculated separately. To calculate the function using every row of the report output, use the WITHIN TABLE phrase. A WITHIN phrase is required.
Reference: Usage Notes for the XIRR Function

- This function is only supported in a COMPUTE command with the WITHIN phrase.
- The cash flow field must contain at least one negative value and one positive value.
- Dates cannot be stored in fields with format A, I, or P. They must be stored in date fields (for example, format YMD, not AYMD).
- Cash flows or dates with missing values are not supported.

Example: Calculating the Internal Rate of Return

The following request creates a FOCUS data source with cash flows and dates and calculates the internal return rate.

The Master File for the data source is:

```plaintext
FILENAME=XIRR01,SUFFIX=FOC
SEGNAME=SEG1,SEGTYPE=S1
FIELDNAME=DUMMY,FORMAT=A2,$
FIELDNAME=DATES,FORMAT=YYMD,$
FIELDNAME=CASHFL,FORMAT=D12.4,$
END
```

The procedure to create the data source is:

```plaintext
CREATE FILE XIRR01
MODIFY FILE XIRR01
FREEFORM DUMMY DATES CASHFL
DATA
AA,19980101,-10000. ,$
BB,19980301,2750.   ,$
CC,19981030,4250.   ,$
DD,19990215,3250.   ,$
EE,19990401,2750.   ,$
END
```
The request is sorted by date so that the correct cash flows can be calculated. The rate returned by the function is multiplied by 100 in order to express it as a percent rather than a decimal value. Note that the format includes the % character. This causes a percent symbol to display, but it does not calculate a percent:

```
TABLE FILE XIRR01
PRINT CASHFL
COMPUTE RATEX/D12.2%=XIRR(CASHFL, DATES, 0., 0., RATEX) * 100;
WITHIN TABLE
   BY DATES
END
```

One rate is calculated for the entire report because of the WITHIN TABLE phrase:

```
<table>
<thead>
<tr>
<th>DATES</th>
<th>CASHFL</th>
<th>RATEX</th>
</tr>
</thead>
<tbody>
<tr>
<td>1998/01/01</td>
<td>-10,000.000</td>
<td>37.49%</td>
</tr>
<tr>
<td>1998/03/01</td>
<td>2,750.000</td>
<td>37.49%</td>
</tr>
<tr>
<td>1998/10/30</td>
<td>4,250.000</td>
<td>37.49%</td>
</tr>
<tr>
<td>1999/02/15</td>
<td>3,250.000</td>
<td>37.49%</td>
</tr>
<tr>
<td>1999/04/01</td>
<td>2,750.000</td>
<td>37.49%</td>
</tr>
</tbody>
</table>
```
PTOA Function

How to:
Convert a Packed Decimal Number to Alphanumeric Format

Example:
Converting From Packed to Alphanumeric Format

The PTOA function converts a packed decimal number from numeric format to alphanumeric format. It retains the decimal positions of the number and right-justifies it with leading spaces. You can also add edit options to a number converted by PTOA.

When using PTOA to convert a number containing decimals to a character string, you must specify an alphanumeric format large enough to accommodate both the integer and decimal portions of the number. For example, a P12.2C format is converted to A14. If the output format is not large enough, the rightmost characters are truncated.

Syntax:

How to Convert a Packed Decimal Number to Alphanumeric Format

PTOA(number, '(format)', outfield)

where:

number
Numeric P (packed decimal)
Is the number to be converted, or the name of the field that contains the number.

format
Alphanumeric
Is the output format of the number enclosed in both single quotation marks and parentheses. Only packed decimal format is supported. Include any edit options that you want to display in the output.

The format value does not have to have the same length or number of decimal places as the original field. If you change the number of decimal places, the result is rounded. If you make the length too short to hold the integer portion of the number, asterisks display instead of the number.

If you use a field name for this argument, specify the name without quotation marks or parentheses. However, parentheses must be included around the format stored in this field. For example:

FMT/A10 = '(P12.2C)';

You can then use this field as the format argument when using the function in your request:

COMPUTE ALPHA_GROSS/A20 = PTOA(PGROSS, FMT, ALPHA_GROSS);
**PTOA Function**

**outfield**

**Alphanumeric**

Is the name of the field that contains the result, or the format of the output value enclosed in single quotation marks. The length of this argument must be greater than the length of *number* and must account for edit options and a possible negative sign.

In Dialogue Manager, you must specify the format. In Maintain, you must specify the name of the field.

**Example: Converting From Packed to Alphanumeric Format**

PTOA is called twice to convert the PGROSS field from packed decimal to alphanumeric format. The format specified in the first call to the function is stored in a virtual field named FMT. The format specified in the second call to the function does not include decimal places, so the value is rounded when displayed:

```plaintext
DEFINE FILE EMPLOYEE
PGROSS/P18.2=GROSS;
FMT/A10='(P14.2C)';
END
TABLE FILE EMPLOYEE PRINT PGROSS NOPRINT
COMPUTE AGROSS/A17 = PTOA(PGROSS, FMT, AGROSS); AS ''
COMPUTE BGROSS/A37 = '<- THIS AMOUNT IS' | 
PTOA(PGROSS, '(P5C)', 'A6') | 
' WHEN ROUNDED'; AS '' IN +1
BY HIGHEST 1 PAY_DATE NOPRINT
BY LAST_NAME NOPRINT
END
```

The output is:

```
2,475.00 <- THIS AMOUNT IS 2,475 WHEN ROUNDED
1,815.00 <- THIS AMOUNT IS 1,815 WHEN ROUNDED
2,255.00 <- THIS AMOUNT IS 2,255 WHEN ROUNDED
  750.00 <- THIS AMOUNT IS   750 WHEN ROUNDED
2,238.50 <- THIS AMOUNT IS 2,239 WHEN ROUNDED
1,540.00 <- THIS AMOUNT IS 1,540 WHEN ROUNDED
1,540.00 <- THIS AMOUNT IS 1,540 WHEN ROUNDED
1,342.00 <- THIS AMOUNT IS 1,342 WHEN ROUNDED
1,760.00 <- THIS AMOUNT IS 1,760 WHEN ROUNDED
1,100.00 <- THIS AMOUNT IS 1,100 WHEN ROUNDED
  791.67 <- THIS AMOUNT IS   792 WHEN ROUNDED
  916.67 <- THIS AMOUNT IS   917 WHEN ROUNDED
```
PUTDDREC and CLSDDREC Functions

How to:
Write a Character String as a Record in a Sequential File
Close All Files Opened by the PUTDDREC Function

Reference:
Usage Notes for the PUTDDREC and CLSDDREC Functions

Example:
Calling PUTDDREC in a TABLE Request
Calling PUTDDREC and CLSDDREC in Dialogue Manager -SET Commands

The PUTDDREC function writes a character string as a record in a flat file. The file must be identified with a CMS FILEDEF command (DYNAM or ALLOCATE on z/OS). If the file is defined with the APPEND option, the new record is appended. Without the APPEND option, the new record overwrites any existing file. For information about the FILEDEF command, see the Overview and Operating Environments manual.

If the file is not already open, PUTDDREC opens it the first time it is called. Each call to PUTDDREC can use the same file or open a new one. All of the files opened by PUTDDREC remain open until the end of a request or session. At the end of the request or session, all files opened by PUTDDREC are closed automatically.

If PUTDDREC is called in a Dialogue Manager -SET command, the files opened by PUTDDREC are not closed automatically until the end of a request or session. In this case, you can manually close the files and free the memory used to store information about open files by calling the CLSDDREC function.
PUTDDREC and CLSDDREC Functions

Syntax: How to Write a Character String as a Record in a Sequential File

PUTDDREC(ddname, dd_len, record_string, record_len, outfield)

where:

**ddname**
- Alphanumeric
- Is the logical name assigned to the sequential file in a CMS FILEDEF command. For information about the CMS FILEDEF command, see the *Overview and Operating Environments* manual.

**dd_len**
- Numeric
- Is the number of characters in the logical name.

**record_string**
- Alphanumeric
- Is the character string to be added as the new record in the sequential file.

**record_len**
- Numeric
- Is the number of characters to add as the new record. It cannot be larger than the number of characters in *record_string*. To write all of *record_string* to the file, *record_len* should equal the number of characters in *record_string* and should not exceed the record length declared in the CMS FILEDEF command. If *record_len* is shorter than the length declared in the CMS FILEDEF command, the resulting file may contain extraneous characters at the end of each record. If *record_string* is longer than the length declared in the CMS FILEDEF command, *record_string* may be truncated in the resulting file.

**outfield**
- Integer
- Is the return code, which can have one of the following values:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Record is added.</td>
</tr>
<tr>
<td>-1</td>
<td>FILEDEF statement is not found.</td>
</tr>
<tr>
<td>-2</td>
<td>Error while opening the file.</td>
</tr>
<tr>
<td>-3</td>
<td>Error while adding the record to the file.</td>
</tr>
</tbody>
</table>
Syntax: How to Close All Files Opened by the PUTDDREC Function

CLSDDREC(outfield)

where:

outfield

Integer

Is the return code, which can be one of the following values:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Files are closed.</td>
</tr>
<tr>
<td>-1</td>
<td>Error while closing the files.</td>
</tr>
</tbody>
</table>

Reference: Usage Notes for the PUTDDREC and CLSDDREC Functions

- The open, close, and write operations are handled by the operating system. Therefore, the requirements for writing to the file and the results of deviating from the instructions when calling PUTDDREC are specific to your operating environment. Make sure you are familiar with and follow the guidelines for your operating system when performing input/output operations.

- You can call PUTDDREC in a DEFINE FILE command or in a DEFINE in the Master File. However, PUTDDREC does not open the file until its field name is referenced in a request.

Example: Calling PUTDDREC in a TABLE Request

The following example defines a new file whose logical name is PUTDD1. The TABLE request then calls PUTDDREC for each employee in the EMPLOYEE data source and writes a record to the file composed of the employee's last name, first name, employee ID, current job code, and current salary (converted to alphanumeric using the EDIT function). The return code of zero (in OUT1) indicates that the calls to PUTDDREC were successful:

```plaintext
CMS FILEDEF PUTDD1 DISK PUTDD1 DATA A -RUN
TABLE FILE EMPLOYEE
PRINT EMP_ID CURR_JOBCODE AS 'JOB' CURR_SAL
COMPUTE SALA/A12 = EDIT(CURR_SAL); NOPRINT
COMPUTE EMP1/A50= LAST_NAME|FIRST_NAME|EMP_ID|CURR_JOBCODE|SALA;
NOPRINT
COMPUTE OUT1/I1 = PUTDDREC('PUTDD1',6, EMP1, 50, OUT1);
BY LAST_NAME BY FIRST_NAME
END
```
The output is:

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>FIRST_NAME</th>
<th>EMP_ID</th>
<th>JOB</th>
<th>CURR_SAL</th>
<th>OUT1</th>
</tr>
</thead>
<tbody>
<tr>
<td>BANNING</td>
<td>JOHN</td>
<td>119329144</td>
<td>A17</td>
<td>$29,700.00</td>
<td>0</td>
</tr>
<tr>
<td>BLACKWOOD</td>
<td>ROSEMARIE</td>
<td>326179357</td>
<td>B04</td>
<td>$21,780.00</td>
<td>0</td>
</tr>
<tr>
<td>CROSS</td>
<td>BARBARA</td>
<td>818692173</td>
<td>A17</td>
<td>$27,062.00</td>
<td>0</td>
</tr>
<tr>
<td>GREENSPAN</td>
<td>MARY</td>
<td>543729165</td>
<td>A07</td>
<td>$9,000.00</td>
<td>0</td>
</tr>
<tr>
<td>IRVING</td>
<td>JOAN</td>
<td>123764317</td>
<td>A15</td>
<td>$26,862.00</td>
<td>0</td>
</tr>
<tr>
<td>JONES</td>
<td>DIANE</td>
<td>117593129</td>
<td>B03</td>
<td>$18,480.00</td>
<td>0</td>
</tr>
<tr>
<td>MCCOY</td>
<td>JOHN</td>
<td>219984371</td>
<td>B02</td>
<td>$18,480.00</td>
<td>0</td>
</tr>
<tr>
<td>MCKNIGHT</td>
<td>ROGER</td>
<td>451123478</td>
<td>B02</td>
<td>$16,100.00</td>
<td>0</td>
</tr>
<tr>
<td>ROMANS</td>
<td>ANTHONY</td>
<td>126724188</td>
<td>B04</td>
<td>$21,120.00</td>
<td>0</td>
</tr>
<tr>
<td>SMITH</td>
<td>MARY</td>
<td>112847612</td>
<td>B14</td>
<td>$13,200.00</td>
<td>0</td>
</tr>
<tr>
<td>SMITH</td>
<td>RICHARD</td>
<td>119265415</td>
<td>A01</td>
<td>$9,500.00</td>
<td>0</td>
</tr>
<tr>
<td>STEVENS</td>
<td>ALFRED</td>
<td>071382660</td>
<td>A07</td>
<td>$11,000.00</td>
<td>0</td>
</tr>
</tbody>
</table>

After running this request, the sequential file contains the following records:

| BANNING   | JOHN       | 119329144| A17000000029700 |
| BLACKWOOD | ROSEMARIE  | 326179357| B04000000021780 |
| CROSS     | BARBARA    | 818692173| A17000000027062 |
| GREENSPAN | MARY       | 543729165| A07000000009000 |
| IRVING    | JOAN       | 123764317| A15000000018480 |
| JONES     | DIANE      | 117593129| B03000000018480 |
| MCCOY     | JOHN       | 219984371| B02000000018480 |
| MCKNIGHT  | ROGER      | 451123478| B02000000016100 |
| ROMANS    | ANTHONY    | 126724188| B04000000021120 |
| SMITH     | MARY       | 112847612| B14000000013200 |
| SMITH     | RICHARD    | 119265415| A0100000009500  |
| STEVENS   | ALFRED     | 071382660| A07000000011000 |

**Example: Calling PUTDDREC and CLSDDREC in Dialogue Manager -SET Commands**

The following example defines a new file whose logical name is PUTDD1. The first -SET command creates a record to add to this file. The second -SET command calls PUTDDREC to add the record. The last -SET command calls CLSDDREC to close the file. The return codes are displayed to make sure operations were successful:

```plaintext
CMS FILEDEF PUTDD1 DISK PUTDD1 DATA A
-RUN
-SET &EMP1 = 'SMITH'|'MARY'|'A07'|'27000';
-TYPE DATA = &EMP1
-SET &OUT1 = PUTDDREC('PUTDD1',6, &EMP1, 17, 'I1');
-TYPE PUT RESULT = &OUT1
-SET &OUT1 = CLSDDREC('I1');
-TYPE CLOSE RESULT = &OUT1
```
The output is:

```
DATA = SMITHMARYA0727000
PUT RESULT = 0
CLOSE RESULT = 0
```

After running this procedure, the sequential file contains the following record:

```
SMITHMARYA0727000
```

**SET ERROROUT = OVERRIDE**

**In this section:**

- Default Error Handling with ERROROUT ON or OFF
- How to:
  - Override Error or Warning Messages
  - Revert to Default Error Handling
- Reference:
  - Usage Notes for SET ERROROUT=OVERRIDE/filename
- Example:
  - Overriding Standard Error Messages

The ERROROUT=OVERRIDE/filename setting enables you to change the severity of error conditions encountered in FOCUS processing. You can change errors to warnings or warnings to errors for specified error messages or ranges of error messages.

**Note:** The ERROROUT setting is ignored in interactive sessions.
**Default Error Handling with ERROROUT ON or OFF**

With ERROROUT=ON, any error message terminates the job step and results in a return code of 8. For warning messages, you can test a Dialogue Manager variable (&FOCERRNUM) to determine whether or not you wish to continue based on the actual return code. ERROROUT=ON is only supported in batch jobs.

With ERROROUT=OFF, the application is permitted to continue regardless of the condition’s severity level, moving ahead to the next control point within the application. OFF is the default value.

As with ERROROUT=ON, warning messages do not invoke this behavior and all actions are left to the user.

By creating an override file, you can redefine the severity of error or warning conditions encountered, causing an application to terminate only under conditions that you consider serious in the context of your application environment. You might, for example, determine that certain default error conditions that normally terminate processing are not serious in your current context, and therefore merit only warnings. With the override file, the application processes as if the ERROROUT setting is OFF but with the changes in severity level indicated by the override file.

**Procedure: How to Change Message Severity Levels**

To override message severity levels:

1. Create a message severity override file. The file must be a sequential file sorted in order of message number. The format of each line is described in *How to Override Error or Warning Messages*.

2. Identify the message severity override file by including the following command in a profile or FOCEXEC.

   ```
   SET ERROROUT=[OVERRIDE/]filename
   ```

   where:

   ```
   filename
   ```

   Is the name of the override file. On z/OS, `filename` must be a member in the concatenation of data sets allocated to DDNAME ERRORS. On z/VM, `filename` is the name of the override file. The override file must have filetype ERRORS.
**Syntax:** How to Override Error or Warning Messages

To implement an override file, use the following syntax. Note that you cannot set this parameter with an ON TABLE SET command.

```
SET ERROROUT=[OVERRIDE/]filename
```

where:

- **filename**
  
  Is the name of the file containing override entries. OVERRIDE/filename is a synonym for filename. The file must be sorted in ascending order of message number. Each entry has the following form:

  - message_number {Warning|W|Error|E}
  
  or

  - start_message_number - end_message_number {Warning|W|Error|E}

  where:

  - **message_number** is the number of a message whose severity level you want to redefine.
  
  - **Warning** or **W** defines the message as a warning message. The option is not case-sensitive.
  
  - **Error** or **E** defines the message as an error message. The option is not case-sensitive.
  
  - **start_message_number** is the beginning of a range of message numbers that will be assigned the same severity level.
  
  - **end_message_number** is the end of the range of message numbers.

Any combination of single messages and message ranges may be included in the override file. Each item must be separated from the next item by a space.
Syntax: **How to Revert to Default Error Handling**

To revert to default error-condition handling after using a message severity override file, issue the following command:

```
SET ERROROUT = {ON|OFF}
```

where:

**ON**

Reinstates the default message file.

The application terminates if a condition is an error, and can continue if a condition is a warning.

**OFF**

Reinstates the default message file. OFF is the default value.

With ERROROUT=OFF, the application is permitted to continue to the next control point within the application regardless of the severity level of the error posted.

**Example: Overriding Standard Error Messages**

Consider the following procedure that generates two warning messages (FOC095 and FOC096) about the SKIP-LINE and SUBFOOT commands:

```
TABLE FILE EMPLOYEE
HEADING CENTER
"Departmental Salary Report </1"
PRINT CURR_JOBCODE AS 'Job Code'
BY DEPARTMENT AS 'Department'
BY LAST_NAME AS 'Last Name'
  ON LAST_NAME SKIP-LINE
BY CURR_SAL AS 'Current,Salary'
ON CURR_SAL SUBFOOT
  "<13 *** WARNING: LAST_NAME 's salary exceeds recommended guidelines."
  WHEN CURR_SAL GT 27000;
ON DEPARTMENT SKIP-LINE
ON DEPARTMENT SUBFOOT
-**"<13 Total salary expense for the <DEP dept is: <ST.CURR_SAL"
END
```
With ERROROUT=OFF, the warning messages display and then the report is generated:

```
ERROR AT OR NEAR LINE     14  IN PROCEDURE OVERRIDEFOCEXEC *
(FOC095) WARNING. PREVIOUS USE OF THIS OPTION IS OVERRIDDEN: SKIP-LINE
ERROR AT OR NEAR LINE     17  IN PROCEDURE OVERRIDEFOCEXEC *
(FOC096) WARNING. NO TEXT SUPPLIED BELOW SUBHEAD OR SUBFOOT
ERROR AT OR NEAR LINE     17  IN PROCEDURE OVERRIDEFOCEXEC *
(FOC096) WARNING. NO TEXT SUPPLIED BELOW SUBHEAD OR SUBFOOT
NUMBER OF RECORDS IN TABLE=       12  LINES=     12
```

**PAUSE.. PLEASE ISSUE CARRIAGE RETURN WHEN READY**

**Departmental Salary Report**

<table>
<thead>
<tr>
<th>Department</th>
<th>Last Name</th>
<th>Salary</th>
<th>Job Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>MIS</td>
<td>BLACKWOOD</td>
<td>$21,780.00</td>
<td>B04</td>
</tr>
<tr>
<td></td>
<td>CROSS</td>
<td>$27,062.00</td>
<td>A17</td>

<td>A07</td>
</tr>
</tbody>
</table>

The ERRORS file named NEWERR identifies 095 and 096 as errors rather than warnings:

```
095 E
096 E
```
Running the same request with the following setting causes the application to terminate without displaying the report output:

```
SET ERROROUT = NEWERR
```

The following messages display with this setting in effect:

```
ERROR AT OR NEAR LINE     14  IN PROCEDURE OVERRIDEFOCEXEC *
(FOC095) WARNING. PREVIOUS USE OF THIS OPTION IS OVERRIDDEN: SKIP-LINE
Exiting due to Exit on Error...
ERROR AT OR NEAR LINE     17  IN PROCEDURE OVERRIDEFOCEXEC *
(FOC096) WARNING. NO TEXT SUPPLIED BELOW SUBHEAD OR SUBFOOT
Exiting due to Exit on Error...
ERROR AT OR NEAR LINE     17  IN PROCEDURE OVERRIDEFOCEXEC *
(FOC096) WARNING. NO TEXT SUPPLIED BELOW SUBHEAD OR SUBFOOT
Exiting due to Exit on Error...
...RETRIEVAL KILLED
(FOC026) THE REPORT IS NO LONGER AVAILABLE
Exiting due to Exit on Error...
```

Reference: Usage Notes for SET ERROROUT=OVERRIDE/filename

For additional details about error handling, see your documentation for SET ERROROUT=ON or OFF. In addition:

- You cannot set the ERROROUT=filename parameter in an ON TABLE SET command.
- ERROROUT settings apply only to batch operations.

**STRREP Function**

**How to:**

Replace Character Strings

**Reference:**

Usage Notes for STRREP Function

**Example:**

Replacing Commas and Dollar Signs

The STRREP function enables you to replace all instances of a specified string within a given input string. It also supports replacement by null strings.
Syntax: How to Replace Character Strings

```
STRREP (inlength, instring, searchlength, searchstring, replength, repstring, outlength, outstring)
```

where:

- `inlength` Numeric
  - Is the number of characters in the input string.

- `instring` Alphanumeric
  - Is the input string.

- `searchlength` Numeric
  - Is the number of characters in the (shorter length) string to be replaced.

- `searchstring` Alphanumeric
  - Is the character string to be replaced.

- `replength` Numeric
  - Is the number of characters in the replacement string. Must be zero (0) or greater. Zero is used to delete a character from a string.

- `repstring` Alphanumeric
  - Is the replacement string (alphanumeric). Ignored if `replength` is zero (0).

- `outlength` Numeric
  - Is the number of characters in the resulting output string. Must be 1 or greater.

- `outstring` Alphanumeric
  - Is the resulting output string after all replacements and padding.

Reference: Usage Notes for STRREP Function

The maximum string length is 4095.
Example: Replacing Commas and Dollar Signs

In the following example, STRREP finds and replaces commas and dollar signs that appear in the CS_ALPHA field, first replacing commas with null strings to produce CS_NOCOMMAS (removing the commas) and then replacing the dollar signs ($) with (USD) in the right-most CURR_SAL column:

```
TABLE FILE EMPLOYEE
SUM CURR_SAL NOPRINT
COMPUTE CS_ALPHA/A15=FTOA(CURR_SAL,'(D12.2M)',CS_ALPHA);
  CS_NOCOMMAS/A14=STRREP(15,CS_ALPHA,1,',',0,'X',14,CS_NOCOMMAS);
  CS_USD/A17=STRREP(14,CS_NOCOMMAS,1,'$',4,'USD ',17,CS_USD);
NOPRINT
  CS_USD/R AS CURR_SAL
BY LAST_NAME
END
```

The output is:

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>CS_ALPHA</th>
<th>CS_NOCOMMAS</th>
<th>CURR_SAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>BANNING</td>
<td>$29,700.00</td>
<td>$29700.00</td>
<td>USD 29700.00</td>
</tr>
<tr>
<td>BLACKWOOD</td>
<td>$21,780.00</td>
<td>$21780.00</td>
<td>USD 21780.00</td>

FOCREPLAY: Recording and Playing Back a FOCUS Session

In this section:
- Configuring FOCREPLAY
- Recording a FOCUS Session
- Replaying a Recorded FOCUS Session
- Comparing a Recorded Session With a Replayed Session
- Stopping Replay at a Break Point
- Re-recording From the Middle or End of a Script

Reference:
- Usage Notes and Prerequisites for FOCREPLAY
- Troubleshooting FOCREPLAY Applications

FOCREPLAY is a tool that enables you to record your keystrokes when executing an interactive FOCUS application and play them back at some time in the future. You invoke the FOCREPLAY functions by allocating the DDNAMEs FOCREPLAY uses for recording and playing back a FOCUS session.

The recording function of FOCREPLAY is called input mode. In this mode, you are in charge of the keyboard. It produces two outputs:

- A script that you can later use to replay the application.
- An output file containing the captured FOCUS session, including any screens displayed during the session.

To play back the script you invoke replay mode, which is activated by allocating a previously recorded script as the input to FOCREPLAY. Replay mode can be run in batch or interactively. During an interactive replay session, FOCREPLAY is in charge of the keyboard. It presents each line in the script and waits for a response from you in order to proceed. Replay mode produces an output file containing the replayed session.

You can then use any file comparison tool installed at your site to compare the original session’s output to the replayed session’s output.

One of the uses for this tool is to simplify acceptance testing of a new release of FOCUS. If you record an application’s execution in your current release and then upgrade to a new release, you can play back the script and compare the resulting output file with the results of the original run to determine if the application produces the same output under the new release.
Reference: Usage Notes and Prerequisites for FOCREPLAY

- FOCREPLAY was tested with IBM’s PC3270 emulator. However, it should work with all 3270 emulators such as EXTRA, Reflections, and Hummingbird if they use standard 3270 job stream calls.

- In order to judge the results of the comparison between the original output and the replay, you must understand any factors in the environment may be different and may affect the outcome. Some examples are expired fields, dates that have passed and are no longer valid, changes to any screen or menu, or the date and time of running the application.

- You should carefully document the conditions for running the script so that you can replicate these conditions accurately when replaying it.

  For example, assume your application contains a MODIFY or Maintain request that includes, updates, or deletes instances from a data source. In order to replay the session and get the same results, you need to run it against a copy of the data source as it was prior to the original run, and you need to run it against the transactions used in the original run.

  You also must keep a record of the operating system release and service level, database engine release, and FOCUS release.

- FOCREPLAY does not do the comparison between the original run and the replay. You can use any file comparison tool you have installed at your site, for example XCOMPARE on z/VM or ISPF 3.13 on z/OS.

- FOCREPLAY cannot be used with any feature that requires allocations outside of FOCUS (for example, FOCCALC or HLI) or with any feature that starts a service (such as MSO). Output of operating system commands is not captured.

Reference: Troubleshooting FOCREPLAY Applications

Before calling in a problem, make sure you have accounted for acceptable differences in the comparison between two releases. For example, when you run your application the second time and you want to compare its output to that of your initial (base) execution of the application, dates, release levels, and operating system messages will be different from the base. Remove these acceptable differences from the comparison between the two runs.
Configuring FOCREPLAY

How to:
Activate FOCREPLAY Input Mode
Issue FILEDEFs for Input Mode on z/VM
Allocate DDNAMEs for Input Mode on z/OS
Activate FOCREPLAY Replay Mode
Issue FILEDEFs for Replay Mode on z/VM
Allocate DDNAMEs for Replay Mode on z/OS

Example:
Sample FILEDEFs for Input Mode on z/VM
Allocating DDNAMEs for Input Mode on z/OS
Sample FILEDEFs for Replay Mode on z/VM
Allocating DDNAMEs for Replay Mode on z/OS

FOCREPLAY is activated by allocating the DDNAMEs it uses to record, capture, and/or replay a FOCUS session. You can add these allocations to your REXX EXEC, CLIST, or batch JCL that invokes FOCUS.

The required disposition for the FOCREPLAY data sets is DISP=MOD. The recommended DCB attributes are RECFM=VB, LRECL=233472, BLKSIZE=23476 (half track blocking), DSORG=PS. If you want the data sets to be members of a library, you can allocate them as members of a PDSE. Because standard PDS data sets do not support DISP=MOD allocation for their members, you cannot allocate the data sets as members of a PDS. If you want to store them in a PDS, you can allocate them as sequential files and copy them to PDS members after they are complete.

If the DCB attributes differ from the recommended values, they will be changed dynamically during the session. You must have read/write access to all of the FOCREPLAY data sets.
FOCREPLAY: Recording and Playing Back a FOCUS Session

**Note:**

- You can make limited edits to a recorded script file. For example, you can insert a break at any point if you want to execute the script up to that point and then stop. The TED editor cannot edit these files. You must use a system editor such as XEDIT on z/VM or the ISPF editor on z/OS to edit them. You can access the system editor from FOCUS using the IEDIT command.

- The FOCREPLAY output files are created in binary mode with required blanks at the end of some of the records. In the ISPF editor, you must issue the PRESERVE ON command to retain these blanks.

**Procedure: How to Activate FOCREPLAY Input Mode**

FOCREPLAY records your FOCUS session if you allocate the following two DDNAMEs:

- **FSC3270I.** This DDNAME will contain the script of the session. You can play back this script to rerun the session by allocating the script file as input to replay mode. The 3270 terminal characteristics and session mode (height, width, graphic support, colors, and external attributes) are automatically recorded in this file. This enables you to record sessions for different types of terminals or different modes. Do not edit these lines.

- **FSC3270O.** This DDNAME will contain the captured FOCUS session.

If you allocate an existing file to either DDNAME, the new script and session output are appended to the existing information in the files.

**Syntax:** How to Issue FILEDEFs for Input Mode on z/VM

```
FILEDEF FSC3270I DISK script_file ft1 fm (DISP MOD
FILEDEF FSC3270O DISK session_output ft2 fm (DISP MOD
```

where:

- `script_file ft1 fm`
  
  Is the filename, filetype, and filemode of the file that will contain the script of the FOCUS session.

- `session_output ft2 fm`
  
  Is the filename, filetype, and filemode of the file that will contain the captured FOCUS session.

**Example:** Sample FILEDEFs for Input Mode on z/VM

```
FILEDEF FSC3270I DISK FSC3270 IN A (DISP MOD
FILEDEF FSC3270O DISK FSC3270 OUT A (DISP MOD
```
**Syntax:** How to Allocate DDNAMEs for Input Mode on z/OS

ALLOC F(FSC3270I) DA('hlq.script.file') MOD
ALLOC F(FSC3270O) DA('hlq.session.output') MOD

where:

*hlq.script.file*

    Is the data set that will contain the script of the FOCUS session.

*hlq.session.output*

    Is the data set that will contain the captured FOCUS session.

**Example:** Allocating DDNAMEs for Input Mode on z/OS

ALLOC F(FSC3270I) DA('USER1.FSC3270I.DATA') MOD
ALLOC F(FSC3270O) DA('USER1.FSC3270O.DATA') MOD

**Procedure: How to Activate FOCREPLAY Replay Mode**

FOCREPLAY replays your FOCUS session and creates a new output file containing the replayed session if you allocate the following three DDNAMEs:

- **FSC3270Q.** This DDNAME must be allocated to the script of the previously recorded session that you want to play back.

- **FSC3270O.** This DDNAME will contain the replayed FOCUS session. If you allocate the same file that was used when you recorded the session, the played back session will be appended to the recorded session. If you allocate a different output file, the played back session will be in a separate file from the original session.

- **FSC3270I.** This DDNAME should be allocated as DUMMY when replaying a session. If you allocate it to a file, you will both play back the session and record a new input script in the allocated file. This is necessary to use the <RECORD> function described later.
**Syntax: How to Issue FILEDEFs for Replay Mode on z/VM**

```sh
FILEDEF FSC3270Q DISK script_file f1 fm (DISP MOD
FILEDEF FSC3270O DISK session2_output f2 fm (DISP MOD
FILEDEF FSC3270I DUMMY

where:

`script_file f1 fm`

Is the filename, filetype, and filemode of the file that contains the script of the previously recorded FOCUS session.

`session2_output f2 fm`

Is the filename, filetype, and filemode of the file that will contain the replayed session.

**Example: Sample FILEDEFs for Replay Mode on z/VM**

```sh
FILEDEF FSC3270Q DISK FSC3270 IN A (DISP MOD
FILEDEF FSC3270O DISK FSC3270 OUT2 A (DISP MOD
FILEDEF FSC3270I DUMMY
```

**Syntax: How to Allocate DDNAMEs for Replay Mode on z/OS**

In a CLIST:

```sh
ALLOC F(FSC3270Q) DA('hlq.script.file') MOD
ALLOC F(FSC3270O) DA('hlq.session2.output') MOD
ALLOC (FSC3270I) DUMMY
```

In a batch job:

```sh
//FSC3270Q DD DISP=MOD,DSN=hlq.script.file
//FSC3270O DD DISP=MOD,DSN=hlq.session2.output
//FSC3270I DD DUMMY
```

where:

`hlq.script.file`

Is the data set that contains the script of the previously recorded FOCUS session.

`hlq.session2.output`

Is the data set that will contain the replayed session.
Example: Allocating DDNAMEs for Replay Mode on z/OS

In a CLIST:

ALLOC F(FSC3270Q) DA('USER1.FSC3270I.DATA') MOD
ALLOC F(FSC3270O) DA('USER1.FSC3270O.DATA2') MOD
ALLOC F(FSC3270I) DUMMY

In a batch job:

//FSC3270Q DD DISP=MOD,DSN=USER1.FSC3270I.DATA
//FSC3270O DD DISP=MOD,DSN=USER1.FSC3270O.DATA2
//FSC3270I DD DUMMY

Recording a FOCUS Session

Example:

Recording a Session Under z/VM
Recording a Session Under z/OS

This section illustrates how to record a FOCUS session under z/VM and z/OS.

Example: Recording a Session Under z/VM

Issue FILEDEF commands for the FOCREPLAY input mode DDNAMEs prior to invoking FOCUS or in the REXX EXEC that invokes FOCUS. For example, the following FILEDEF commands define new data sets to contain the session script and the session output:

FILEDEF FSC3270I DISK FSSCRIPT IN A (DISP MOD
FILEDEF FSC3270O DISK FSC3270 OUTBASE A (DISP MOD

You must invoke FOCUS without a profile:

EX FOCUS (NOPROF

If you need a profile, execute the profile as the first command after invoking FOCUS.
The following FOCUS session issues a TABLE request against the MOVIES data source. This session is recorded by FOCREPLAY as a result of executing the REXX EXEC containing the FILEDEF commands for DDNAMEs FSC3270I and FSC3270O.

Issue the following TABLE request:

```
> > TABLE FILE MOVIES
> PRINT RATING DIRECTOR TITLE/A20
> BY CATEGORY
> WHERE CATEGORY EQ 'DRAMA' OR 'MYSTERY' OR 'CHILDREN'
> END
```

NUMBER OF RECORDS IN TABLE= 18 LINES= 18

PAUSE.. PLEASE ISSUE CARRIAGE RETURN WHEN READY

Press Enter to display the first screen of the report:

```plaintext

Press Enter to display the second screen of the report:

```
PAGE     2

CATEGORY  RATING  DIRECTOR           TITLE
--------  ------  --------           -----       
MYSTERY   R       BECKER H.          SEA OF LOVE
```

END OF REPORT

Issue the FIN command to exit FOCUS:

```
FIN
```

Once you issue the FIN command, you are no longer in FOCUS, so recording stops. However, if you want to invoke FOCUS at this point without recording the new session, you must free the FOCREPLAY FILEDEFS. If you do not, the new session’s script will be appended to the existing script file and its output will be appended to the existing output file.
Example:  **Recording a Session Under z/OS**

You can create the two files needed for FOCREPLAY input mode prior to executing the CLIST used to invoke FOCUS or in the CLIST. If you create these files in the CLIST, you must then free the allocations and reallocate them with DISP MOD. For example, the following commands allocate new data sets to contain the session script and the session output:

```
ALLOC F(FSC3270I) NEW DA('USER1.FSC.SCRIPT') ,
    SPACE(50,10) TRACKS LRECL(23472) BLKSIZE(23476) ,
    DSORG(PS) RECFM(V)
ALLOC F(FSC3270O) NEW DA('USER1.FSC.OUTBASE') ,
    SPACE(50,10) TRACKS LRECL(23472) BLKSIZE(23476) ,
    DSORG(PS) RECFM(V)
```

The following commands free these allocations and reallocate the data sets with DISP MOD:

```
FREE F(FSC3270I)
FREE F(FSC3270O)
ALLOC F(FSC3270I) REUSE MOD DA('USER1.FSC.SCRIPT')
ALLOC F(FSC3270O) REUSE MOD DA('USER1.FSC.OUTBASE')
```

The following FOCUS session issues a TABLE request against the MOVIES data source. This session is recorded by FOCREPLAY as a result of executing the CLIST containing the allocations for DDNAMEs FSC3270I and FSC32700.

Issue the following TABLE request:

```
>   > TABLE FILE MOVIES
>   PRINT RATING DIRECTOR TITLE/A20
>   BY CATEGORY
>   WHERE CATEGORY EQ 'DRAMA' OR 'MYSTERY' OR 'CHILDREN'
>   END

NUMBER OF RECORDS IN TABLE=       18  LINES=     18

PAUSE.. PLEASE ISSUE CARRIAGE RETURN WHEN READY
```
Press Enter to display the first screen of the report:

END OF REPORT

Issue the FIN command to exit FOCUS:

```
FIN
```

Once you issue the FIN command, you are no longer in FOCUS, so recording stops. However, if you want to invoke FOCUS at this point without recording the new session, you must free the FOCREPLAY allocations. If you do not, the new session's script will be appended to the existing script file and its output will be appended to the existing output file.
Replaying a Recorded FOCUS Session

How to:
Replay a Recorded FOCUS Session Interactively

Reference:
FOCREPLAY PFKeys

Example:
Replaying a Recorded FOCUS Session Interactively Under z/VM
Replaying a Recorded FOCUS Session Interactively Under z/OS

You can replay a recorded FOCUS session interactively or in a batch job. Note: Do not allocate DDNAMEs SYSIN or SYSPRINT in the FOCREPLAY batch job.

If you replay the session interactively, you must press a key in order to proceed from one line to the next in the script. Press Enter to move through the script line by line or, if your FOCUS session is accepting input, you can press a PFkey to move more quickly through the script.

Procedure: How to Replay a Recorded FOCUS Session Interactively

1. Allocate or FILEDEF the required DDNAMES in your CLIST that invokes FOCUS.
   Allocate:
   - DDNAME FSC3270Q to the file containing the previously recorded script.
   - DDNAME FSC3270O to the file to receive the replayed session output.
   - DDNAME FSC3270I as DUMMY

2. Execute your REXX EXEC or CLIST that invokes FOCUS.
   The first line in the script displays on the screen.

3. Press Enter to invoke the next line in the script or, if your FOCUS session is accepting input, you can press a PFkey to move more quickly through the script.

4. Continue pressing Enter or a PFkey to move through the script.
   When the FIN command is replayed, the FOCUS session ends, and the replay stops.

   Note: If you want to invoke FOCUS at this point without replaying the session again, you must clear the FOCREPLAY FILEDEFs or free the FOCREPLAY allocations. If you do not, the new session output will be appended to the existing output file.
**Reference: FOCREPLAY PFKeys**

If your FOCUS session is accepting input, you can press the Enter key to step through the session line by line, or you can press one of the following PFkeys:

<table>
<thead>
<tr>
<th>PFkey</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>F1</td>
<td>Plays the next 10 script lines with no confirmation.</td>
</tr>
<tr>
<td>F2</td>
<td>Plays the next 20 script lines with no confirmation.</td>
</tr>
<tr>
<td>F3</td>
<td>Plays the next 30 script lines with no confirmation.</td>
</tr>
<tr>
<td>F4</td>
<td>Plays the next 40 script lines with no confirmation.</td>
</tr>
<tr>
<td>F5</td>
<td>Plays the next 50 script lines with no confirmation.</td>
</tr>
<tr>
<td>F6</td>
<td>Plays the next 60 script lines with no confirmation.</td>
</tr>
<tr>
<td>F7</td>
<td>Plays the next 70 script lines with no confirmation.</td>
</tr>
<tr>
<td>F8</td>
<td>Plays the next 80 script lines with no confirmation.</td>
</tr>
<tr>
<td>F9</td>
<td>Plays the next 90 script lines with no confirmation.</td>
</tr>
<tr>
<td>F10</td>
<td>Plays the next 100 script lines with no confirmation.</td>
</tr>
<tr>
<td>F11</td>
<td>Plays to the end of the script or to a break point with no confirmations.</td>
</tr>
<tr>
<td>F12</td>
<td>Quit (exits FOCUS by issuing Abend U610-1). At this point you must log off and on again to clean up after the abend.</td>
</tr>
<tr>
<td>F24</td>
<td>Exits to a live FOCUS session. If you are re-recording a session (by allocating an input file), you can input new key strokes at this point.</td>
</tr>
</tbody>
</table>

**Example: Replaying a Recorded FOCUS Session Interactively Under z/VM**

The REXX EXEC that invokes FOCUS has the following FOCREPLAY FILEDEFs:

- The previously recorded script:
  ```
  'FILEDEF FSC3270Q DISK FSSCRIPT IN A'
  ```
- The output of the replayed session:
  ```
  'FILEDEF FSC3270O DISK FSC3270 OUTNEW A (DISP MOD'
  ```
- The dummy FILEDEF for DDNAME FSC3270I:
  ```
  'FILEDEF FSC3270I DUMMY'
  ```
Once the REXX EXEC executes and invokes FOCUS, the first line of the script file displays:

```
> > TABLE FILE MOVIES
```

You can press Enter, or you can press one of the FOCREPLAY PFkeys described in *FOCREPLAY PFKeys*.

For this example, press Enter to execute this line. The next line displays:

```
> PRINT RATING DIRECTOR TITLE/A20
```

Press Enter to execute this line. The next line displays:

```
> BY CATEGORY
```

Press Enter to execute this line. The next line displays:

```
> WHERE CATEGORY EQ 'DRAMA' OR 'MYSTERY' OR 'CHILDREN'
```

Press Enter to execute this line. The next line displays:

```
> END
```

Press Enter to execute this line. The report summary lines display:

```
NUMBER OF RECORDS IN TABLE= 18 LINES= 18
PAUSE.. PLEASE ISSUE CARRIAGE RETURN WHEN READY
```
Press Enter. The first screen of report output displays:

<table>
<thead>
<tr>
<th>CATEGORY</th>
<th>RATING</th>
<th>DIRECTOR</th>
<th>TITLE</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHILDREN</td>
<td>NR</td>
<td>BARTON C.</td>
<td>SMURFS, THE</td>
</tr>
<tr>
<td></td>
<td>G</td>
<td>BARON C.</td>
<td>SHAGGY DOG, THE</td>

<td>BAMBI</td>
</tr>
<tr>
<td>DRAMA</td>
<td>R</td>
<td>LUMET S.</td>
<td>DOG DAY AFTERNOON</td>
</tr>
<tr>
<td>MYSTERY</td>
<td>PG</td>
<td>HITCHCOCK A.</td>
<td>REAR WINDOW</td>
</tr>
<tr>
<td></td>
<td>PG</td>
<td>HITCHCOCK A.</td>
<td>VERTIGO</td>
</tr>
<tr>
<td></td>
<td>R</td>
<td>GRANT M.</td>
<td>FATAL ATTRACTION</td>
</tr>
<tr>
<td></td>
<td>NR</td>
<td>HITCHCOCK A.</td>
<td>NORTH BY NORTHWEST</td>
</tr>
<tr>
<td></td>
<td>R</td>
<td>CRONENBERG D.</td>
<td>DEAD RINGERS</td>
</tr>
<tr>
<td></td>
<td>R</td>
<td>LUMET S.</td>
<td>MORNING AFTER, THE</td>
</tr>
<tr>
<td></td>
<td>R</td>
<td>HITCHCOCK A.</td>
<td>PSYCHO</td>
</tr>
<tr>
<td></td>
<td>PG13</td>
<td>HITCHCOCK A.</td>
<td>BIRDS, THE</td>
</tr>
</tbody>
</table>
Press Enter. The next screen of report output displays:

```
PAGE       2

CATEGORY   RATING   DIRECTOR            TITLE
----------   ------   --------            -----    
MYSTERY      R       BECKER H.        SEA OF LOVE

END OF REPORT
```

Press Enter. The next line of the script displays:

```
> > FIN
```

Press Enter to execute this line.

Once the FIN command executes, you exit FOCUS, so replay ends. However, if you want to invoke FOCUS at this point without replaying the session again, you must clear the FOCREPLAY FILEDEFS. If you do not, the new session output will be appended to the existing output file.

After replaying a session, you have one output file from the recorded session and another output file from the replayed session. You can compare these two output files.
Example: **Replaying a Recorded FOCUS Session Interactively Under z/OS**

The CLIST that invokes FOCUS has the following FOCREPLAY allocations:

- The previously recorded script:
  
  ```
  ALLOC F(FSC3270Q) DA ('USER1.FSC.SCRIPT') MOD
  ```

- The output of the replayed session:
  
  ```
  ALLOC F(FSC3270O) DA ('USER1.FSC.OUTNEW') MOD
  ```

- The dummy allocation for DDNAME FSC3270I:
  
  ```
  ALLOC F(FSC3270I) DUMMY
  ```

Once the CLIST executes, the first line of the script file displays:

```
>   >  TABLE FILE MOVIES
```

You can press Enter, or you can press one of the FOCREPLAY PFkeys described in *FOCREPLAY PFKeys*.

For this example, press Enter to execute this line. The next line displays:

```
>   PRINT RATING DIRECTOR TITLE/A20
```

Press Enter to execute this line. The next line displays:

```
>   BY CATEGORY
```

Press Enter to execute this line. The next line displays:

```
>   WHERE CATEGORY EQ 'DRAMA' OR 'MYSTERY' OR 'CHILDREN'
```

Press Enter to execute this line. The next line displays:

```

</tbody>
</table>

END OF REPORT

Press Enter. The next line of the script displays:

> > FIN

Press Enter to execute this line.

Once the FIN command executes, you exit FOCUS, so replay ends. However, if you want to invoke FOCUS at this point without replaying the session again, you must free the FOCREPLAY allocations. If you do not, the new session output will be appended to the existing output file.

After replaying a session, you have one output file from the recorded session and another output file from the replayed session. You can compare these two output files.
Comparing a Recorded Session With a Replayed Session

Example: Comparing Two Sessions Using the XCOMPARE Facility on z/VM
Comparing Two Sessions Using the ISPF SuperCE Utility

FOCREPLAY does not compare output files. You can use any file comparison tool installed at your site to perform the comparison. When you view the results, you must determine which differences are acceptable and do not indicate a change in your application's operation.

Example: Comparing Two Sessions Using the XCOMPARE Facility on z/VM

Issue the following command at the Ready prompt:

```
XCOMPARE FSC3270 OUTBASE A FSC3270 OUTNEW A (DISK
```

The result of the comparison is placed in the file XCOMPARE LISTING A1:

```
1COMPARING 'FSC3270 OUTBASE A1' WITH 'FSC3270 OUTNEW A1'
0FILE 1 1 O: FOCUS 7.3.7 06/06/2006 16.06.11 GEN01.01
0FILE 2 1 O: FOCUS 7.3.7 06/06/2006 16.18.02 GEN01.01
0FILE 1 36 I00007: {Enter}{024-002}
0FILE 2 60 I00007: {Enter}{024-002}
0FILE 1 68 I00008: {Enter}{024-002}
0FILE 2 92 I00008: {Enter}{024-002}
0COMPARISON COMPLETED - RETURN CODE IS    8.
```

The differences in the two files are the lines with the date and time stamp and lines inserted by FOCREPLAY. These differences are acceptable and do not indicate a change in the operation of the application.
Example: Comparing Two Sessions Using the ISPF SuperCE Utility

Go to option 3.13 (the SuperCE Utility) from the ISPF Primary Option Menu.

Enter the names of the two output files on the screen and press Enter to start the comparison. This example accepts the default comparison options:

```
SuperCE Utility
Command ==> New DS Name . . . 'USER1.FSC.OUTBASE'
Old DS Name . . . 'USER1.FSC.OUTNEW'

PDS Member List              (blank/pattern - member list, * - compare all)
   (Leave New/Old DSN "blank" for concatenated-uncataloged-password panel)
   Compare Type            Listing Type            Display Output
   2  1. File                 2  1. OVSUM                1  1. Yes
   2. Line                    2. Delta                   2. No

Listing DSN . . . . SUPERC.LIST
```

The results are placed in a file named USER1.SUPERC.LIST and are automatically displayed when the comparison is complete. In this example, the only lines that are different are those that show the date and time of the two runs. This difference does not indicate a change in the operation of the application:

```
LISTING OUTPUT SECTION (LINE COMPARE)

PROCESS OPTIONS USED: NONE

ISRS004I LISTING LINES MAY BE TRUNCATED DUE TO LIMITING OUTPUT LINE WIDTH.
### Stopping Replay at a Break Point

If you want to stop the replay at a break point, edit the input file and add the following on a line by itself right in front of the last line you want executed before the break point:

```
<BREAK>
```

On replay (online only), the input sequence is replayed up to the line following the break point, and then the keyboard is opened for stepwise motion through the remainder of the script using existing PF key functions. This technique enables you to get to a specific point in a long script very quickly.

If you use F10 or F11 to move down in the script, and a break is encountered along the way, replay stops at the break point rather than proceeding to where the PF key would have taken you.

You can set multiple break points in a script file by inserting multiple `<BREAK>` commands in the file.

### Re-recording From the Middle or End of a Script

In order to continue recording a partially recorded session, you must allocate DDNAME FSC3270I to a file that will contain the new version of the script. The existing script must be in a different file, allocated to DDNAME FSC3270Q. In addition, if you allocate an existing output file to DDNAME FSC3270O (to receive the session output), the new output will appended to the existing output. If you want the re-recorded session to go to a separate file, allocate a new output file to DDNAME FSC3270O.

To start recording where you left off last time, remove the FIN command and execute replay mode online. The existing script will be re-recorded to the new script file. At the end of the existing script, the keyboard will open for input, and your key strokes will be recorded at the end of the new script file.

To start recording in the middle of a script file, edit the existing script file and add the following on a line by itself at the point in the script at which you want to start re-recording:

```
<RECORD>
```

In an online session, the replay tool plays the existing script and re-records it to the new script file. When it encounters the `<RECORD>` command, it opens the keyboard for further input that will be recorded and added to the end of the new script file.

This technique eliminates trailing lines after a mistake and enables you to re-record the remainder of the session.

In this way, you do not have to start recording from scratch when a mistake is made during the recording session or when you stop at some point but want to continue recording later.
&FOCFEXNAME Variable

You must allocate the new script file to DDNAME FSC3270Q when replaying the corrected or extended session.

&FOCFEXNAME Variable

The Dialogue Manager variable &FOCFEXNAME returns the name of the FOCEXEC running even if it was executed using an EX command or a -INCLUDE command from within another FOCEXEC. This variable differs from the &FOCFOCEXEC variable because &FOCFOCEXEC returns the name of the calling FOCEXEC only.

Example: Retrieving the Name of the Active FOCEXEC

The following request consists of three procedures.

The main procedure, FEXNAME1, types the values of the variables &FOCFOCEXEC and &FOCFEXNAME and then includes the procedure called FEXNAME3:

- TYPE THIS IS FOCEXEC NUMBER 1
  - TYPE FOCFOCEXEC = &FOCFOCEXEC
  - TYPE FOCFEXNAME = &FOCFEXNAME
  - TYPE
  - INCLUDE FEXNAME3

The procedure FEXNAME3, includes the procedure called FEXNAME2 and then types the values of the variables &FOCFOCEXEC and &FOCFEXNAME:

TABLE FILE EMPLOYEE
  - INCLUDE FEXNAME2
  - TYPE THIS IS FOCEXEC 3
  - TYPE FOCFOCEXEC = &FOCFOCEXEC
  - TYPE FOCFEXNAME = &FOCFEXNAME
  - TYPE
  PRINT CURR_JOBCODE
  BY DEPARTMENT
  BY LAST_NAME
  BY FIRST_NAME
  END

The procedure FEXNAME2, types the values of the variables &FOCFOCEXEC and &FOCFEXNAME:

- TYPE THIS IS FOCEXEC 2
  - TYPE FOCFOCEXEC = &FOCFOCEXEC
  - TYPE FOCFEXNAME = &FOCFEXNAME
  - TYPE
  HEADING CENTER
  "EMPLOYEES BY DEPARTMENT"
  " "

252 Information Builders
The output shows that the variable &FOCFOCEXEC always returns the name of the main procedure, while &FOCFEXNAME returns the name of the active procedure whether it is the main procedure or an included procedure:

```
EX FEXNAME1
THIS IS FOCEXEC NUMBER 1
FOCFOCEXEC = FEXNAME1
FOCFEXNAME = FEXNAME1

THIS IS FOCEXEC 2
FOCFOCEXEC = FEXNAME1
FOCFEXNAME = FEXNAME2

THIS IS FOCEXEC 3
FOCFOCEXEC = FEXNAME1
FOCFEXNAME = FEXNAME3
```

### Controlling Missing Values in Reformatted Fields

**How to:**
Control Missing Values in Reformatted Fields

**Reference:**
Usage Notes for SET COMPMISS

**Example:**
Controlling Missing Values in Reformatted Fields

When a field is reformatted in a request (for example, SUM field/format), an internal COMPUTE field is created to contain the reformatted field value and display on the report output. If the original field has a missing value, that missing value can be propagated to the internal field by setting the COMPMISS parameter ON. If the missing value is not propagated to the internal field, it displays a zero (if it is numeric) or a blank (if it is alphanumeric). If the missing value is propagated to the internal field, it displays the missing data symbol on the report output.
Syntax: **How to Control Missing Values in Reformatted Fields**

```plaintext
SET COMPMISS = {ON | OFF}
```

where:

- **ON**
  - Propagates a missing value to a reformatted field. ON is the default value.

- **OFF**
  - Displays a blank or zero for a reformatted field.

**Note:** The COMPMISS parameter cannot be set in an ON TABLE command.

Example: **Controlling Missing Values in Reformatted Fields**

The following procedure prints the RETURNS field from the SALES data source for store 14Z. With COMPMISS OFF, the missing values display as zeros in the column for the reformatted field value. **(Note:** Before trying this example, you must make sure that the SALEMISS procedure, which adds missing values to the SALES data source, has been run.)

```plaintext
SET COMPMISS = OFF
TABLE FILE SALES
PRINT RETURNS RETURNS/D12.2 AS 'REFORMATTED,RETURNS'
BY STORE_CODE
WHERE STORE_CODE EQ '14Z'
END
```

The output is:

<table>
<thead>
<tr>
<th>STORE_CODE</th>
<th>RETURNS</th>
<th>REFORMATTED RETURNS</th>
</tr>
</thead>
<tbody>
<tr>
<td>14Z</td>
<td>2</td>
<td>2.00</td>
</tr>
<tr>
<td>2</td>
<td>2.00</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>.00</td>
<td></td>
</tr>
<tr>
<td>.</td>
<td>.00</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>4.00</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>.00</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>3.00</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>4.00</td>
<td></td>
</tr>
<tr>
<td>.</td>
<td>.00</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>4.00</td>
<td></td>
</tr>
</tbody>
</table>
With COMPMISS ON, the column for the reformatted version of RETURNS displays the missing data symbol when a value is missing:

```
SET COMPMISS = ON
TABLE FILE SALES
PRINT RETURNS RETURNS/D12.2 AS 'REFORMATTED,RETURNS'
BY STORE_CODE
WHERE STORE_CODE EQ '14Z'
END
```

The output is:

<table>
<thead>
<tr>
<th>STORE_CODE</th>
<th>RETURNS</th>
<th>REFORMATTED</th>
</tr>
</thead>
<tbody>
<tr>
<td>14Z</td>
<td>2</td>
<td>2.00</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
<td>2.00</td>
</tr>
<tr>
<td>0</td>
<td>.</td>
<td>.00</td>
</tr>
<tr>
<td>.</td>
<td>.</td>
<td>.</td>
</tr>
<tr>
<td>4</td>
<td>4</td>
<td>4.00</td>
</tr>
<tr>
<td>0</td>
<td>.</td>
<td>.00</td>
</tr>
<tr>
<td>3</td>
<td>3</td>
<td>3.00</td>
</tr>
<tr>
<td>4</td>
<td>4</td>
<td>4.00</td>
</tr>
<tr>
<td>.</td>
<td>.</td>
<td>.</td>
</tr>
<tr>
<td>4</td>
<td>4</td>
<td>4.00</td>
</tr>
</tbody>
</table>

**Reference: Usage Notes for SET COMPMISS**

If you create a HOLD file with COMPMISS ON, the HOLD Master File for the reformatted field indicates MISSING = ON (as does the original field). With COMPMISS = OFF, the reformatted field does NOT have MISSING = ON in the generated Master File.

**Controlling Case Sensitivity of Passwords**

**How to:**
Control Password Case Sensitivity

**Example:**
Controlling Password Case Sensitivity

When a DBA or user issues the SET USER, SET PERMPASS or SET PASS command, this user ID is validated before they are given access to any data source whose Master File has DBA attributes. The password is also checked when encrypting or decrypting a FOCEXEC.
Controlling Case Sensitivity of Passwords

The SET DBACSENSITIV command determines whether the password is converted to upper case prior to validation.

Syntax:  **How to Control Password Case Sensitivity**

```sql
SET DBACSENSITIV = {ON|OFF}
```

where:

**ON**

Does not convert passwords to upper case. All comparisons between the password set by the user and the password in the Master File or FOCEXEC are case sensitive.

**OFF**

Converts passwords to upper case prior to validation. All comparisons between the password set by the user and the password in the Master File or FOCEXEC are not case sensitive. OFF is the default value.

Example:  **Controlling Password Case Sensitivity**

Consider the following DBA declaration added to the EMPLOYEE Master File:

```
USER = User2, ACCESS = RW,$
```

User2 wants to report from the EMPLOYEE data source and issues the following command:

```
SET USER = USER2
```

With DBACSENSITIV OFF, User2 can run the request even though the case of the password entered does not match the case of the password in the Master File.

With DBACSENSITIV ON, User2 gets the following message:

```
(FOC047) THE USER DOES NOT HAVE SUFFICIENT ACCESS RIGHTS TO THE FILE:
```

With DBACSENSITIV ON, the user must issue the following command:

```
SET USER = User2
```

**Note:** In FOCUS for Mainframe, all user input is transmitted in upper case. Therefore, a mixed case password cannot be issued at the command line. It must be set in a FOCEXEC or profile.
SLEEP Function

How to:
Suspend Execution for a Specified Number of Seconds

Example:
Suspending Execution for Four Seconds

As of FOCUS 7.6.3, you can suspend FOCUS execution for a specified number of seconds. The SLEEP function suspends execution for the number of seconds you specify as its input argument.

This function is most useful in Dialogue Manager when you need to wait to start a specific procedure. For example, you can start a FOCUS Database Server and wait until the server is started before initiating a client application.

Syntax: How to Suspend Execution for a Specified Number of Seconds

SLEEP(delay, outfld);

where:

delay
  Numeric
  Is the number of seconds to delay execution. The number can be specified down to the millisecond.

outfld
  Numeric
  Is the name of a field or a format enclosed in single quotation marks. The value returned is the same value you specify for delay.

Example: Suspending Execution for Four Seconds

The following example computes the current date and time, suspends execution for 4 seconds, and computes the current date and time after the delay:

```
TABLE FILE VIDEOTRK
PRINT TRANSDATE NOPRINT
COMPUTE
START_TIME/HYYMDSa = HGETC(8, START_TIME);
DELAY/I2 = SLEEP(4.0, 'I2');
END_TIME/HYYMDSa = HGETC(8, END_TIME);
IF RECOR DLIMIT EQ 1
END
```
Setting a Currency Symbol for the M and N Format Options

The output is:

<table>
<thead>
<tr>
<th>START_TIME</th>
<th>DELAY</th>
<th>END_TIME</th>
</tr>
</thead>
<tbody>
<tr>
<td>2007/10/26</td>
<td>5:04:36pm</td>
<td>4</td>
</tr>
</tbody>
</table>

**Setting a Currency Symbol for the M and N Format Options**

**How to:**

Specify a Currency Symbol

**Example:**

Displaying the Japanese Yen Symbol

As of FOCUS 7.6.4, SET CURRSYMB determines which currency symbol will be displayed when a format specification uses the M and N edit options.

**Syntax:**

**How to Specify a Currency Symbol**

```
SET CURRSYMB = symbol
```

In a request, use

```
ON TABLE SET CURRSYMB symbol
```

where:

`symbol`

Is any printable character or a supported currency code. **Note:** In order to specify a dollar sign as the character, you must enclose it in single quotation marks (‘$’). The following are supported currency codes:

- USD or ‘$’ specifies U. S. dollars.
- GBP specifies the British pound.
- JPY specifies the Japanese yen.
- EUR specifies the Euro.
Example: Displaying the Japanese Yen Symbol

The following request uses the EMPLOYEE data source and sets the currency symbol to the Japanese yen. Since the EMPLOYEE Master File specifies the format D12.2M for the CURR_SAL field, the yen symbol displays as the currency symbol for its field values:

```
TABLE FILE EMPLOYEE
PRINT CURR_SAL
BY LAST_NAME
ON TABLE SET CURRSYMB JPY
ON TABLE COLUMN-TOTAL
END
```

The output is:

```
LAST_NAME       CURR_SAL
---------------  --------
BANNING          ¥29,700.00
BLACKWOOD        ¥21,780.00
CROSS            ¥27,062.00
GREENSPAN        ¥9,000.00
IRVING           ¥26,862.00
JONES            ¥18,480.00
MCCOY            ¥18,480.00
MCKNIGHT         ¥16,100.00
ROMANS           ¥21,120.00
SMITH            ¥13,200.00
                   ¥9,500.00
STEVENS          ¥11,000.00

TOTAL             ¥222,284.00
```
ISO Standard Week Numbering and the HYYWD Function

Starting in Version 7.6.5, you can extract week numbers from date-time values using the ISO 8601 standard definition.

The HPART and HNAME subroutines can extract a week number from a date-time value. To determine a week number, they can use ISO 8601 standard week numbering, which defines the first week of the year as the first week in January with four or more days. Any preceding days in January belong to week 52 or 53 of the preceding year. The ISO standard also establishes Monday as the first day of the week.

These functions can also define the first week of the year as the first week in January with seven days. This is the definition they used in prior releases.

You specify which type of week numbering to use by setting the WEEKFIRST parameter.

Since the week number returned by HNAME and HPART functions can be in the current year or the year preceding or following, the week number by itself may not be useful. The function HYYWD returns both the year and the week from a given date-time value.

Syntax: **How to Specify the First Day of the Week**

\[ \text{SET WEEKFIRST} = \text{value} \]

where:

\[ \text{value} \]

Can be:

1 through 7, representing Sunday through Saturday with non-standard week numbering

or

ISO1 through IS07, representing Sunday through Saturday with ISO standard week numbering. \textbf{Note:} ISO is a synonym for ISO2.

The ISO standard establishes Monday as the first day of the week, so to be fully ISO compliant, the WEEKFIRST parameter should be set to ISO or ISO2.
**Example:** Extracting the Week Component From a Date-Time Value

In the following request, HNAME extracts the week in alphanumeric format from the TRANSDATE field. Changing the WEEKFIRST setting changes the value of the extracted component.

```plaintext
TABLE FILE VIDEOTR2
PRINT CUSTID TRANSDATE AS 'DATE-TIME' AND COMPUTE
WEEK_COMPONENT/A10 = HNAME(TRANSDATE, 'WEEK', 'A10');
WHERE DATE EQ 1991 AND QUANTITY GT 1
END
```

When WEEKFIRST is set to 2, the output is:

```
CUSTID  DATE-TIME         WEEK_COMPONENT
------  ---------         --------------
0925    1991/06/27 02:45  25
1297    1991/06/24 04:43  25
1423    1991/06/25 01:17  25
```

When WEEKFIRST is set to ISO2, the output is:

```
CUSTID  DATE-TIME         WEEK_COMPONENT
------  ---------         --------------
0925    1991/06/27 02:45  26
1297    1991/06/24 04:43  26
1423    1991/06/25 01:17  26
```

**HYYWD Function: Returning the Year and Week Number From a Date-time Value**

**How to:**

Return the Year and Week Number From a Date-time Value

**Example:**

Returning the Year and Week Number From a Date-time Value

Extracting a Component From a Date Returned by HYYWD

The week number returned by HNAME and HPART can actually be in the year preceding or following the input date.

The HYYWD function returns both the year and the week number from a given date-time value.

The output is edited to conform to the ISO standard format for dates with week numbers, yyyy-Www-d.
**ISO Standard Week Numbering and the HYYWD Function**

**Syntax:**

_How to Return the Year and Week Number From a Date-time Value_

\[
\text{HYYWD}(\text{dtvalue}, \text{outfield})
\]

where:

**dtvalue**

Date-time
Is the date-time value to be edited, the name of a date-time field that contains the value, or an expression that returns the value.

**outfield**

Alphanumeric
Is the field that contains the result, or the format of the output value enclosed in single quotation marks.
The field must be at least 10 characters long. The output is in the following format:

\[
\text{yyyy-Www-d}
\]

where:

**yyyy**

Is the four-digit year.

**ww**

Is the two-digit week number (01 to 53).

**d**

Is the single-digit day of the week (1 to 7). The \(d\) value is relative to the current WEEKFIRST setting. If WEEKFIRST is 2 or ISO2 (Monday), then Monday is represented in the output as 1, Tuesday as 2.

Using the EDIT function, you can extract the individual subfields from this output.

**Example:** _Returning the Year and Week Number From a Date-time Value_

The following request against the VIDEOTR2 data source calls HYYWD to convert the TRANSDATE date-time field to the ISO standard format for dates with week numbers. WEEKFIRST is set to ISO2, which produces ISO standard week numbering:

```plaintext
SET WEEKFIRST = ISO2
TABLE FILE VIDEOTR2
SUM TRANSTOT QUANTITY
COMPUTE ISODATE/A10 = HYYWD(TRANSDATE, 'A10');
BY TRANSDATE
WHERE QUANTITY GT 1
END
```
The output is:

<table>
<thead>
<tr>
<th>TRANSDATE</th>
<th>TRANSTOT</th>
<th>QUANTITY</th>
<th>ISODATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1991/06/24 04:43</td>

**Example: Extracting a Component From a Date Returned by HYYWD**

The following request against the VIDEOTR2 data source calls HYYWD to convert the TRANSDATE date-time field to the ISO standard format for dates with week numbers. It then uses the EDIT function to extract the week component from this date. WEEKFIRST is set to ISO2, which produces ISO standard week numbering:

```
SET WEEKFIRST = ISO2
TABLE FILE VIDEOTR2
SUM TRANSTOT QUANTITY
COMPUTE ISODATE/A10 = HYYWD(TRANSDATE, 'A10');
COMPUTE WEEK/A2 = EDIT(ISODATE, '$$$$99$$');
BY TRANSDATE
WHERE QUANTITY GT 1 AND DATE EQ 1991
END
```

The output is:

<table>
<thead>
<tr>
<th>TRANSDATE</th>
<th>TRANSTOT</th>
<th>QUANTITY</th>
<th>ISODATE</th>
<th>WEEK</th>
</tr>
</thead>
<tbody>
<tr>
<td>1991/06/24 04:43</td>
<td>16.00</td>
<td>2</td>
<td>1991-W26-1</td>
<td>26</td>
</tr>
<tr>
<td>1991/06/25 01:17</td>
<td>2.50</td>
<td>2</td>
<td>1991-W26-2</td>
<td>26</td>
</tr>
<tr>
<td>1991/06/27 02:45</td>
<td>16.00</td>
<td>2</td>
<td>1991-W26-4</td>
<td>26</td>
</tr>
</tbody>
</table>
Starting in Version 7.6.5, you can examine a string to see if it follows a standard pattern. The PATTERN function examines a source string and produces a pattern that indicates the sequence of numbers, uppercase letters, and lowercase letters in the input string. In the output pattern, any character from the input that represented a digit becomes the character ‘9’, any character that represents an uppercase letter becomes ‘A’, and any character that represents a lowercase letter becomes ‘a’. Special characters remain unchanged. An unprintable character becomes the character ‘X’. This function is useful for examining data to make sure that it follows a standard pattern.

**Syntax:**  
**How to Generate a Pattern From an Input String**

```
PATTERN (length, infield, outfield)
```

where:

**infield**
- Alphanumeric
  - Is a field containing the input string, or a literal string enclosed in single quotation marks.

**length**
- Numeric
  - Is the length of **infield**.

**outfield**
- Alphanumeric
  - Is the name of the field to contain the result or the format of the field enclosed in single quotation marks.
Example: Producing a Pattern From Alphanumericic Data

The following 19 records are stored in a fixed format sequential file (with LRECL 14) named TESTFILE:

- 212-736-6250
- 212 736 4433
- 123-45-6789
- 800-969-INFO
- 10121-2898
- 10121
- 2 Penn Plaza
- 917-339-6380
- 917-339-4350
- (212) 736-6250
- (212) 736-4433
- 212-736-6250
- 212-736-6250
- 212-736-6250
- (212) 736 5533
- (212) 736 5533
- (212) 736 5533
- 10121
- 800-969-INFO

The Master File is:

    FILENAME=TESTFILE, SUFFIX=FIX,  
    SEGMENT=TESTFILE, SEGTYPE=S0,  
    FIELDNAME=TESTFLD, USAGE=A14, ACTUAL=A14,  

The following request generates a pattern for each instance of TESTFLD and displays them by the pattern that was generated. It shows the count of each pattern and its percentage of the total count. The PRINT command shows which values of TESTFLD generated each pattern.

    CMS FILEDEF TESTFILE DISK TESTFILE FOCTEMP A  
    DEFINE FILE TESTFILE  
        PATTERN/A14 = PATTERN (14, TESTFLD, 'A14' ) ;  
    END  
    TABLE FILE TESTFILE  
        SUM CNT.PATTERN AS 'COUNT' PCT.CNT.PATTERN AS 'PERCENT'  
        BY PATTERN  
        PRINT TESTFLD  
            BY PATTERN  
        ON TABLE COLUMN-TOTAL  
    END
Note that the next to last line produced a pattern from an input string that contained an unprintable character, so that character was changed to X. Otherwise, each numeric digit generated a 9 in the output string, each uppercase letter generated the character ‘A’, and each lowercase letter generated the character ‘a’. The output is:

<table>
<thead>
<tr>
<th>PATTERN</th>
<th>COUNT</th>
<th>PERCENT</th>
<th>TESTFLD</th>
</tr>
</thead>
<tbody>

**REVERSE Function**

**How to:**
Reverse the Characters in a String

**Example:**
Reversing the Characters in a String

Starting in Version 7.6.5, you can use REVERSE to reverse the characters in a string.

The REVERSE function reverses the characters of a string. This reversal includes all trailing blanks, which then become leading blanks. However, in an HTML report with SET SHOWBLANKS=OFF (the default value), the leading blanks are not visible.
Syntax:  **How to Reverse the Characters in a String**

\[
\text{REVERSE}(\text{length, string, outfield})
\]

where:

\textit{length}

Integer

Is the length in characters of \textit{string} and \textit{outfield}, or a field that contains the length.

\textit{string}

Alphanumeric

Is the character string enclosed in single quotation marks, or a field that contains the character string.

\textit{outfield}

Alphanumeric

Is the name of the field that contains the result, or the format of the output value enclosed in single quotation marks.

**Example:  Reversing the Characters in a String**

In the following request against the EMPLOYEE data source, the \textit{REVERSE} function is used to reverse the characters in the \textit{LAST_NAME} field to produce the field named \textit{REVERSE\_LAST}. In this field, the trailing blanks from \textit{LAST\_NAME} have become leading blanks. The \textit{TRIM} function is used to strip the leading blanks from \textit{REVERSE\_LAST} to produce the field named \textit{TRIM\_REVERSE}:

```
DEFINE FILE EMPLOYEE
REVERSE\_LAST/A15 = REVERSE(15, LAST\_NAME, REVERSE\_LAST);
TRIM\_REVERSE/A15 = TRIM('L', REVERSE\_LAST, 15, ' ', 1, 'A15');
END

TABLE FILE EMPLOYEE
PRINT REVERSE\_LAST TRIM\_REVERSE
BY LAST\_NAME
END
```
XTPACK Function

The output is:

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>REVERSE_LAST</th>
<th>TRIM_REVERSE</th>
</tr>
</thead>
<tbody>
<tr>
<td>BANNING</td>
<td>GNINNAB</td>
<td>GNINNAB</td>

</tbody>
</table>

XTPACK Function

Starting in Version 7.6.5, you can write packed fields from 1 to 16 bytes to an output file.

The `XTPACK` function stores packed numbers with up to 31 significant digits in an alphanumeric field, retaining decimal data. This permits writing a short or long packed field of any length, 1 to 16 bytes, to an output file.

Syntax: **How to Store Packed Values in an Alphanumeric Field**

```
XTPACK (infield, outlength, outdec, outfield)
```

where:

- `infield` Numeric
  - Is the field that contains the packed value.

- `outlength` Numeric
  - Is the length of the alphanumeric field that will hold the converted packed field. Can be from 1 to 16.
**outdec**

Numeric

Is the number of decimal positions for `outfield`.

**outfield**

Alphanumeric

Is the name of the field to contain the result or the format of the field enclosed in single quotation marks.

**Example: Writing a Long Packed Number to an Output File**

The following request creates a long packed decimal field named `LONGPCK` that has format `P25.2` and is created by adding the number `11111111111111111111` to `PCT_INC`. `ALPHAPCK` (format `A13`) is the result of applying `XTPACK` to the long packed field. `ALPHAPCK` contains a packed number stored in an alphanumeric field and is not printable, so `HEX_ALPHAPCK` converts it to its printable hexadecimal equivalent using the `UFMT` subroutine. `PCT_INC`, `LONGPCK`, `ALPHAPCK`, and `HEX_ALPHAPCK` are then written to an alphanumeric HOLD file named `XTOUT`.

```plaintext
SET HOLDLIST = PRINTONLY
DEFINE FILE EMPLOYEE
LONGPCK/P25.2 = PCT_INC + 11111111111111111111;
ALPHAPCK/A13 = XTPACK(LONGPCK,13,2,'A13');
END
TABLE FILE EMPLOYEE
PRINT PCT_INC LONGPCK ALPHAPCK
END
```

The following request prints the `PCT_INC`, `LONGPCK`, and `HEX_ALPHAPCK` fields from the `XTOUT` HOLD file (`ALPHAPCK` is not printable):

```plaintext
TABLE FILE XTOUT
PRINT PCT_INC LONGPCK HEX_ALPHAPCK
END
```
The output shows that the HEX_ALPHAPCK field is the packed equivalent of the LONGPCK field. The sign is at the end of packed numbers. Note that a positive sign may be represented as either C or F, depending on operating environment:

<table>
<thead>
<tr>
<th>PCT_INC</th>
<th>LONGPCK</th>
<th>HEX_ALPHAPCK</th>
</tr>
</thead>
<tbody>
<tr>
<td>.10</td>
<td>11111111111111111111.10</td>
<td>0001111111111111111111111111111110C</td>
</tr>
<tr>
<td>.12</td>
<td>11111111111111111111.12</td>
<td>0001111111111111111111111111111112C</td>
</tr>
<tr>
<td>.10</td>
<td>11111111111111111111.10</td>
<td>0001111111111111111111111111111110C</td>
</tr>
<tr>
<td>.04</td>
<td>11111111111111111111.04</td>
<td>0001111111111111111111111111111104C</td>
</tr>
<tr>
<td>.05</td>
<td>11111111111111111111.05</td>
<td>0001111111111111111111111111111105C</td>
</tr>
<tr>
<td>.10</td>
<td>11111111111111111111.10</td>
<td>0001111111111111111111111111111110C</td>
</tr>
<tr>
<td>.15</td>
<td>11111111111111111111.15</td>
<td>0001111111111111111111111111111115C</td>
</tr>
<tr>
<td>.07</td>
<td>11111111111111111111.07</td>
<td>0001111111111111111111111111111107C</td>
</tr>
<tr>
<td>.04</td>
<td>11111111111111111111.04</td>
<td>0001111111111111111111111111111104C</td>
</tr>
<tr>
<td>.05</td>
<td>11111111111111111111.05</td>
<td>0001111111111111111111111111111105C</td>
</tr>
</tbody>
</table>

The Master File created as a result of the HOLD command follows. ALPHAPCK is described as A13:

FILENAME=XTOUT, SUFFIX=FIX, $ 
SEGMENT=XTOUT, SEGTYPE=S0, $ 
   FIELDNAME=PCT_INC, ALIAS=E01, USAGE=F6.2, ACTUAL=A06, $ 
   FIELDNAME=LONGPCK, ALIAS=E02, USAGE=P25.2, ACTUAL=A25, $ 
   FIELDNAME=ALPHAPCK, ALIAS=E03, USAGE=A13, ACTUAL=A13, $ 
   FIELDNAME=HEX_ALPHAPCK, ALIAS=E04, USAGE=A26, ACTUAL=A26, $ 

You can now create a new data source with the packed values written to the XTOUT HOLD file. In the HOLD file, ALPHAPCK is described as A13, but it contains packed values, not alphanumeric data. In the new data source to be created, those packed values will be loaded into the field named PACKEDVAL that is described as USAGE=P25.2, ACTUAL=P16. The field LONGPCK from the HOLD file contains the alphanumeric equivalent of the packed value, so it is loaded into ALPHAVAL in the new data source:

FILENAME=XTPACKIN, SUFFIX=FIX, $ 
SEGMENT=XTPACKIN, SEGTYPE=S0, $ 
   FIELDNAME=PCT_INC, ALIAS=E01, USAGE=F6.2, ACTUAL=F4, $ 
   FIELDNAME=ALPHAVAL, ALIAS=E02, USAGE=A25, ACTUAL=A25, $ 
   FIELDNAME=PACKEDVAL, ALIAS=E03, USAGE=P25.2, ACTUAL=P16, $
The following request creates the XTPACKIN data source and loads it with data from the HOLD file XTOUT. Note that the incoming packed transaction value from the HOLD file is described as P13:

```plaintext
CMS FILEDEF XTPACKIN DISK XTPACKIN FOCTEMP A
CREATE FILE XTPACKIN
-RUN
MODIFY FILE XTPACKIN
FIXFORM PCT_INC/6 ALPHAVALE/25 PACKEDVAL/P13
DATA ON XTOUT
END
```

The following request prints the values in the data source just created:

```plaintext
TABLE FILE XTPACKIN
PRINT *
END
```

The output shows that the long packed data was loaded and displays correctly. In the data source, the LONGPCK field contains the alphanumeric value and the ALPHAPCK field contains the packed equivalent:

<table>
<thead>
<tr>
<th>PCT_INC</th>
<th>ALPHAVALE</th>
<th>PACKEDVAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>.10</td>
<td>11111111111111111111.10</td>
<td>11111111111111111111.10</td>
</tr>
<tr>
<td>.12</td>
<td>11111111111111111111.12</td>
<td>11111111111111111111.12</td>
</tr>
<tr>
<td>.10</td>
<td>11111111111111111111.10</td>
<td>11111111111111111111.10</td>

</tr>
<tr>
<td>.05</td>
<td>11111111111111111111.05</td>
<td>11111111111111111111.05</td>
</tr>
</tbody>
</table>

**Alternate Extended Currency Symbol**

Starting in Version 7.6.5, the extended currency symbol format has been extended. The colon (:) has been added as an alternate for the exclamation point (!) for displaying extended currency symbols.
Extended currency symbol formats are specified as two-character combinations in the last position of any numeric display format. The first character in the combination can be either an exclamation point (!) or a colon (:). The exclamation point is not consistent on all EBCDIC code pages and may produce unexpected behavior if the code page you are using translates the exclamation point differently:

<table>
<thead>
<tr>
<th>Display Option</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>!d or :d</td>
<td>Fixed dollar sign.</td>
<td>D12.2:d</td>
</tr>
<tr>
<td>!D or :D</td>
<td>Floating dollar sign.</td>
<td>D12.2:D</td>
</tr>
<tr>
<td>!e or :e</td>
<td>Fixed euro symbol.</td>
<td>F9.2:e</td>
</tr>
<tr>
<td>!E or :E</td>
<td>Floating euro symbol on the left side.</td>
<td>F9.2:E</td>
</tr>
<tr>
<td>!F or :F</td>
<td>Floating euro symbol on the right side.</td>
<td>F9.2:F</td>
</tr>
<tr>
<td>!l or :l</td>
<td>Fixed British pound sign.</td>
<td>D12.1:l</td>
</tr>
<tr>
<td>!L or :L</td>
<td>Floating British pound sign.</td>
<td>D12.1:L</td>
</tr>
<tr>
<td>!y or :y</td>
<td>Fixed Japanese yen symbol.</td>
<td>I9:y</td>
</tr>
<tr>
<td>!Y or :Y</td>
<td>Floating Japanese yen symbol.</td>
<td>I9:Y</td>
</tr>
</tbody>
</table>

**Reference: Extended Currency Symbol Formats**

The following guidelines apply:

- A format specification cannot be longer than eight characters.
- The extended currency option must be the last option in the format.
- The extended currency symbol format cannot include the floating (M) or non-floating (N) display option.
- A non-floating currency symbol is displayed only on the first row of a report page. If you use field-based reformatting to display multiple currency symbols in a report column, only the symbol associated with the first row is displayed. In this case, do not use non-floating currency symbols.
- Lowercase letters are transmitted as uppercase letters by the terminal I/O procedures. Therefore, the fixed extended currency symbols can only be specified in a procedure.
Extended currency symbol formats can be used with fields in floating point, decimal, packed, and integer formats. Alphanumeric and variable character formats cannot be used.

**SET SUWEDGE**

**How to:**

Wedge Master Files Open on a FOCUS Database Server

**Reference:**

Usage Notes for SET SUWEDGE

**Example:**

Wedging Open Files on a FOCUS Database Server

Starting in Version 7.6.5, keep master Files in memory on a sink machine.

The SET SUWEDGE command provides a mechanism for keeping Master files in memory on a FOCUS Database Server (sink machine) even though no users are accessing the files. This enhances performance by eliminating repeated parsing of Master files on FOCUS Database Servers that have a large number of users running multiple applications using different files on the Server.

You can specify that a number of files be wedged open, that specific named files be wedged open, or a combination of both. The maximum number of files that will be wedged open is 128, regardless of how many you specify.

**Syntax:** How to Wedge Master Files Open on a FOCUS Database Server

Place one or more of the following commands in the FOCUS Database Server profile (PROFILE HLI on z/VM, and member HLIPROF of the FOCEEXEC data set on z/OS):

```
SET SUWEDGE = {n|ddname} [, {n|ddname} ...]
```

where:

- **n**
  
  Is a number of Master Files to be wedged open. You can specify any number, but once 128 files are wedged open, additional files will not be wedged. The default is zero.

- **ddname**
  
  Is the ddname of a specific file to be wedged open in addition to the n files specified by number (if any).
**Note:** To set both a number of files to be wedged and one or more specific DDNAMEs to be wedged, you can issue the SET SUWEDGE command multiple times or specify multiple options in one SET SUWEDGE command. Specific DDNAMEs are not counted in the number of files specified (as long as the total does not exceed the maximum number of wedged files allowed). If you specify a number multiple times, the last one specified is the one used.

**Reference: Usage Notes for SET SUWEDGE**

- The most improvement in performance is gained by wedging open large Master Files and those used most often in MODIFY applications.

- Master Files are not opened by the SUWEDGE facility until a MODIFY or Maintain procedure that references them is executed.

- If a wedged Master File has a static cross reference to another Master File, only the parent Master File is wedged open when it is used in a MODIFY or Maintain application. A cross-referenced file is only wedged open when it is explicitly referenced in a MODIFY or Maintain procedure.

- All Master Files that participate in a COMBINE structure are opened when the COMBINE structure is referenced in a MODIFY application. Similarly, all files participating in a MAINTAIN procedure are opened when the Maintain procedure is executed.

- Using the SUWEDGE facility causes increased use of memory on the FOCUS Database Server.

- The maximum number of Master Files that can be open at one time on a FOCUS Database Server is 256, regardless of wedging.

- Files whose names begin with a number cannot be wedged open by explicitly specifying their names in the SET SUWEDGE command.

- If you specify a number of files to be wedged open and you issue a TABLE request on the FOCUS Database Server, the FOCUSSU file will be wedged open.

- You can see which files have been wedged open by examining the HLIPRINT file. The first OPN command listed for a wedged file will be associated with the user ID suwedge.
**Example: Wedging Open Files on a FOCUS Database Server**

The following commands wedge open any three FOCUS data sources plus the EMPLOYEE and CAR data sources:

```
SET SUWEDGE = 3
SET SUWEDGE = EMPLOYEE
SET SUWEDGE = CAR
```

or

```
SET SUWEDGE = 3
SET SUWEDGE = EMPLOYEE, CAR
```

or

```
SET SUWEDGE = EMPLOYEE, CAR
SET SUWEDGE = 3
```

or

```
SET SUWEDGE = 3, EMPLOYEE, CAR
```
This chapter described enhancements affecting databases and Master Files.

Declaring Filters in a Master File

How to:
Declare a Filter in a Master File
Use a Master File Filter in a Request

Example:
Defining and Using a Master File Filter

Reference:
Usage Notes for Filters in a Master File

Boolean virtual fields (DEFINE fields that evaluate to TRUE or FALSE) can be used as record selection criteria. If the primary purpose of a virtual field is for use in record selection, you can clarify this purpose and organize virtual fields in the Master File by storing the expression using a FILTER declaration rather than a DEFINE. Filters offer the following features:

- They allow you to organize and store popular selection criteria in a Master File and reuse them in multiple requests and tools.
- For some data sources (such as VSAM and ISAM), certain filter expressions can be inserted inline into the WHERE or IF clause, enhancing optimization compared to a Boolean DEFINE.

Syntax: How to Declare a Filter in a Master File

FILTER  filtername = expression;

where:

filtername
Is the name assigned to the filter. The filter is internally assigned a format of I1, which cannot be changed.

eexpression
Is a logical expression that evaluates to TRUE (which assigns the value 1 to the filter field) or FALSE (which assigns the value 0 to the filter field). For any other type of expression, the field becomes a standard numeric virtual field in the Master File. Dialogue Manager variables (amper variables) can be used in the filter expression in same way they are used in standard Master File DEFINEs.
Syntax: How to Use a Master File Filter in a Request

TABLE FILE filename
.
.
.
{WHERE|IF} expression_using_filters
where:

expression_using_filters

Is a logical expression that references a filter. In a WHERE phrase, the logical expression can reference one or more filters and/or virtual fields.

Reference: Usage Notes for Filters in a Master File

- The filter field name is internally assigned a format of I1 which cannot be changed.
- A filter can be used as a standard numeric virtual field anywhere in a report request, except that they are not supported in WHERE TOTAL tests.

Example: Defining and Using a Master File Filter

Consider the following filter declaration added to the MOVIES Master File:

FILTER G_RATING = RATING EQ 'G' OR 'PG';$

The following request applies the G_RATING filter:

TABLE FILE MOVIES
HEADING CENTER
"Rating G and PG"
PRINT TITLE CATEGORY RATING
WHERE G_RATING
ON TABLE SET PAGE NOPAGE
ON TABLE SET GRID OFF
ON TABLE HOLD FORMAT HTML
ON TABLE SET STYLE *
type=report, style=bold, color=black, backcolor=yellow, $
type=data, backcolor=aqua, $
ENDSTYLE
END
Describing GROUP Fields as a Set of Elements

A GROUP declaration in a Master File describes several fields as a single entity. One use of a group is to describe group keys in a VSAM data source. Sometimes referring to several fields by one group name facilitates ease of reporting.

How to:
Describe a GROUP Field as a Set of Elements

Reference:
Usage Notes for Group Elements

Example:
Declaring a GROUP With ELEMENTS
Traditionally, when describing a GROUP field, you had to take account of the fact that while the USAGE and ACTUAL format for the GROUP field are both alphanumeric, the length portion of the USAGE format for the group had to be calculated as the sum of the component lengths, where each integer or single precision field counted as 4 bytes, each double precision field as 8 bytes, and each packed field counted as either 8 or 16 bytes depending on its size.

To avoid the need to calculate these lengths, you can use the GROUP ELEMENTS option, which describes a group as a set of elements without USAGE and ACTUAL formats.

**Syntax:  **  
How to Describe a GROUP Field as a Set of Elements

```
GROUP=group1, ALIAS=g1alias, ELEMENTS=n1,$  
   FIELDNAME=field11, ALIAS=alias11, USAGE=ufmt11, ACTUAL=afmt11, $  
         .  
         .  
         .  
   FIELDNAME=field1h, ALIAS=alias1h, USAGE=ufmt1h, ACTUAL=afmt1h, $  
GROUP=group2, ALIAS=g2alias, ELEMENTS=n2,$  
   FIELDNAME=field21, ALIAS=alias21, USAGE=ufmt21, ACTUAL=afmt21, $  
         .  
         .  
         .  
   FIELDNAME=field2k, ALIAS=alias2k, USAGE=ufmt2k, ACTUAL=afmt2k, $  
```

where:

- **group1, group2**
  Are valid names assigned to a group of fields. The rules for acceptable group names are the same as the rules for acceptable field names.

- **n1, n2**
  Are the number of elements (fields and/or groups) that compose the group. If a group is defined within another group, the subgroup (with all of its elements) counts as one element of the parent group.

- **field11, field2k**
  Are valid field names.

- **alias11, alias2k**
  Are valid alias names.

- **ufmt11, ufmt2k**
  Are USAGE formats for each field.

- **afmt11, afmt2k**
  Are ACTUAL formats for each field.
Describing GROUP Fields as a Set of Elements

Reference: Usage Notes for Group Elements

- To use the ELEMENTS attribute, the GROUP field declaration should specify only a group name and number of elements.
- If a group declaration specifies USAGE and ACTUAL without the ELEMENTS attribute, the USAGE and ACTUAL are accepted as specified, even if incorrect.
- If a group declaration specifies USAGE and ACTUAL with the ELEMENTS attribute, the ELEMENTS attribute takes precedence.
- Each subgroup counts as one element. Its individual fields and subgroups do not count in the number of elements of the parent group.

Example: Declaring a GROUP With ELEMENTS

In the following Master File, GRP2 consists of two elements, fields FIELDA and FIELDB. GRP1 consists of two elements, GRP2 and field FIELDC. Field FIELDD is not part of a group:

FILENAME=XYZ, SUFFIX=FIX, $
SEGMENT=XYZ, SECTYPE=S2,$
GROUP=GRP1, ALIAS=CCR, ELEMENTS=2,$
GROUP=GRP2, ALIAS=CC, ELEMENTS=2,$
   FIELDNAME=FIELDA, ALIAS=E01, USAGE=A10, ACTUAL=A10,$
   FIELDNAME=FIELDB, ALIAS=E02, USAGE=A16, ACTUAL=A16,$
   FIELDNAME=FIELDC, ALIAS=E03, USAGE=P27, ACTUAL=A07,$
   FIELDNAME=FIELDD, ALIAS=E04, USAGE=D7, ACTUAL=A07,$

The following chart shows the offsets and formats of these fields.

<table>
<thead>
<tr>
<th>Field Number</th>
<th>Field Name</th>
<th>Offset</th>
<th>USAGE</th>
<th>ACTUAL</th>
</tr>
</thead>

Specifying Multilingual Descriptions in a Master File

How to:
Specify Multilingual DESCRIPTION Attributes in a Master File
Activate the Use of a Language

Example:
Using Multilingual Descriptions in a Master File

Reference:
Languages and Language Codes
Usage Notes for Multilingual Metadata

Master Files support descriptions in multiple languages. The description used depends on the value of the LANG parameter and whether a DESC_in attribute is specified in the Master File, where in identifies the language to which the description applies. In order to display these descriptions properly, all of the languages used must be consistent with your NLS configuration.

Syntax: How to Specify Multilingual DESCRIPTION Attributes in a Master File

For a file declaration in a Master File, use the following syntax

```
FILE = filename,
.
.
.
{REMARKS|DESC} = default_desc
DESC_in = desc_for_in
.
.
.
```
For a field, use the following syntax

```
FIELDNAME = field, ...
  .
  .
TITLE = default_column_heading
TITLE_ln = column_heading_for_ln
  .
  .
DESC = default_desc
DESC_ln = desc_for_ln
  .
  .
```

where:

- **field**
  Is a field in the Master File.

- **default_column_heading**
  Is the column heading to use when SET TITLES=ON and either the LANG parameter is set to the default language for the server, or another language is set but the Master File has no corresponding TITLE_ln attribute for that field. This column heading is also used if the ln value is invalid.

- **TITLE_ln**
  Specifies the language to which the associated column heading applies.

- **column_heading_for_ln**
  Specifies the text of the column heading for the specified language. That column heading is used when SET TITLES=ON, the LANG parameter is set to a non-default language for FOCUS, and the Master File has a corresponding TITLE_ln attribute, where ln is the two-digit code for the language specified by the LANG parameter. Valid values for ln are the two-letter ISO 639 language code abbreviations.

- **default_desc**
  Is the description to use when either the LANG parameter is set to the default language for the server, or another language is set but the Master File has no corresponding DESC_ln attribute for that field. This description is also used if an the ln value is invalid.

- **DESC_ln**
  Specifies the language to which the associated description applies.
**desc_for_ln**

Specifies the description text for the specified language. This description is used when the LANG parameter is set to a non-default language for FOCUS and the Master File has a corresponding DESC_{ln} attribute. Valid values for ln are the two-letter ISO 639 language code abbreviations.

</table>
Syntax:  

**How to Activate the Use of a Language**

Issue the following command in a supported profile, on the command line, or in a FOCEXEC:

```
SET LANG = lng
```

or

```
SET LANG = ln
```

In the NLSCGF ERRORS configuration file, issue the following command

```
LANG = lng
```

where:

- `lng`
  - Is the three-letter abbreviation for the language.

- `ln`
  - Is the two-letter ISO language code.

**Note:** If SET LANG is used in a procedure, its value will override the values set in NLSCGF ERRORS or in any profile.
Reference: Usage Notes for Multilingual Metadata

- To generate the correct characters, all languages used must be on the code page specified at startup.
- Master Files should be stored using the code page used by FOCUS.
- Multilingual descriptions are supported with all fields described in the Master File, including DEFINE and COMPUTE fields.
- The user must create the NLSCFG file. On z/OS, the NLSCFG file must be a member in the concatenation of data sets allocated to DDNAME ERRORS. On z/VM, it must have filetype ERRORS.

Example: Using Multilingual Descriptions in a Master File

The following Master File for the CENTINV data source specifies French descriptions (DESC_FR) and Spanish descriptions (DESC_ES) as well as default descriptions (DESC) for the PROD_NUM and PRODNAME fields:

```
FILE=CENTINV, SUFFIX=FOC, FDFC=19, FYRT=00
SEGNAME=INVINFO, SEGTYP=S1, $
  FIELD=PROD_NUM, ALIAS=PNUM, FORMAT=A4, INDEX=I,
    DESCRIPTION='Product Number'
    DESC='Product Number',
    DESC_ES='Numero de Producto',
    DESC_FR='Nombre de Produit', $
FIELD=PRODNAME, ALIAS=PNAME, FORMAT=A30,
    WITHIN=PRODCAT,
    DESCRIPTION='Product Name'
    DESC_FR='Nom de Produit',
    DESC_ES='Nombre de Producto', $
FIELD=QTY_IN_STOCK, ALIAS=QIS, FORMAT=I7,
    DESCRIPTION='Quantity In Stock', $
FIELD=PRICE, ALIAS=RETAIL, FORMAT=D10.2,
    TITLE='Price:',
    DESCRIPTION=Price, $
```
Specifying Multilingual TITLE Attributes in a Master File

In a Master File, column headings are taken from:

1. A heading specified in the report request using the AS phrase.

2. A TITLE attribute in the Master File, if no AS phrase is specified in the request and SET TITLES=ON.

3. The field name specified in the Master File, if no AS phrase or TITLE attribute is specified, or if SET TITLES=OFF.

Master Files support column headings in multiple languages. The heading used depends on the value of the LANG parameter and whether a TITLE_in attribute is specified in the Master File, where in identifies the language to which the column heading applies.
**Syntax:**  **How to Specify Multilingual TITLE Attributes in a Master File**

```
FIELDNAME = field, ...
  ...
  ...
TITLE= default_column_heading
  ...
  ...
TITLE_ln = column_heading_for_ln
  ...
  ...

where:

field
  Is a field in the Master File.

default_column_heading
  Is the column heading to use when SET TITLES=ON and either the LANG parameter is set to the default language for FOCUS, or another language is set but the Master File has no corresponding TITLE_ln attribute for that field. This column heading is also used if an the ln value is invalid.
```
**TITLE**<sub>_ln</sub>

Specifies the language for which the column heading applies. Valid values for \textit{ln} are the two-letter ISO 639 language code abbreviations:

<table>
<thead>
<tr>
<th>Language Name</th>
<th>Two-Letter Language Code</th>
<th>Three-Letter Language Abbreviation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arabic</td>
<td>ar</td>
<td>ARB</td>
</tr>
<tr>
<td>Baltic</td>
<td>lt</td>
<td>BAL</td>
</tr>
<tr>
<td>Chinese - Simplified GB</td>
<td>zh</td>
<td>PRC</td>
</tr>
<tr>
<td>Chinese - Traditional Big-5</td>
<td>tw</td>
<td>ROC</td>
</tr>
<tr>
<td>Czech</td>
<td>cs</td>
<td>CZE</td>

</tbody>
</table>
Specifying Multilingual TITLE Attributes in a Master File

Syntax: **How to Activate the Use of a Language**

Issue the following command in a supported profile, on the command line, or in a FOCEXEC:

```
SET LANG = lng
```

or

```
SET LANG = ln
```

In the NLSCGF ERRORS configuration file, issue the following command

```
LANG = lng
```

where:

- **lng**
  
  Is the three-letter abbreviation for the language. For a list of supported languages, see *How to Specify Multilingual TITLE Attributes in a Master File*.

- **ln**
  
  Is the two-letter ISO language code. For a list of supported codes, see *How to Specify Multilingual TITLE Attributes in a Master File*.

**Note:** If SET LANG is used in a procedure, its value will overwrite the values set in NLSCGF ERRORS or in any profile.

**Reference: Usage Notes for Multilingual Titles**

- To generate the correct characters, all languages used must be on the code page specified at startup. To change the code page, you must stop and restart the server with the new code page.

- Master Files should be stored using the code page used by FOCUS.

- Multilingual titles are supported with all fields described in the Master File, including DEFINE and COMPUTE fields.

- If you issue a HOLD command, only one TITLE attribute is propagated to the HOLD Master File. Its value is the column heading that would have appeared on the report output.

- After it is referenced in a request, the Master File is stored in memory. If you want to produce a report against the same Master File but generate column titles in a different language, you must make sure the Master File is re-read after you issue the SET LANG command and prior to running the request. You can make sure the Master File is re-read by issuing a CHECK FILE command for that Master File.
The user must create the NLSCFG file. On z/OS, the NLSCFG file must be a member in the concatenation of data sets allocated to DDNAME ERRORS. On z/VM, it must have filetype ERRORS.

**Example: Using Multilingual Titles in a Request**

The following Master File for the CENTINV data source specifies French titles (TITLE_FR) and Spanish titles (TITLE_ES) as well as default titles (TITLE) for the PROD_NUM and PRODNAME fields:

```
FILE=CENTINV, SUFFIX=FOC, FDPC=19, FYRT=00
SEGNAME=INVINFO, SEGTYPE=S1, $
   FIELD=PROD_NUM, ALIAS=PNUM, FORMAT=A4, INDEX=I,
   TITLE='Product,Number:',
   TITLE_FR='Nombre,de Produit:',
   TITLE_ES='Numero,de Producto:',
   DESCRIPTION='Product Number', $
FIELD=PRODNAME, ALIAS=PNAME, FORMAT=A30,
   TITLE='Product,Name:',
   TITLE_FR='Nom,de Produit:',
   TITLE_ES='Nombre,de Producto:'
DESCRIPTION='Product Name', $
FIELD=QTY_IN_STOCK, ALIAS=QIS, FORMAT=I7,
   TITLE='Quantity,In Stock:',
   DESCRIPTION='Quantity In Stock', $
FIELD=PRICE, ALIAS=RETAIL, FORMAT=D10.2,
   TITLE='Price:',
   DESCRIPTION='Price', $
```

The default language is English and, by default, SET TITLES=ON. Therefore, the following request uses the TITLE attributes to produce column headings that are all in English:

```
TABLE FILE CENTINV
PRINT PROD_NUM PRODNAME PRICE
WHERE PRICE LT 200
END
```

The output is:

```
Product  Product  Price:
Number:  Name:                               -----
-------  -------                             ------
1004     2 Hd VCR LCD Menu                  179.00
1008     DVD Upgrade Unit for Cent. VCR      199.00
1026     AR3 35MM Camera 10 X                129.00
1028     AR2 35MM Camera 8 X                 109.00
1030     QX Portable CD Player               169.00
1032     R5 Micro Digital Tape Recorder      89.00
```
Now, issue the following command to set the language to Spanish:

\texttt{SET LANG = SPA}

Issue the CHECK FILE CENTINV command to re-read the Master File, and rerun the request.

The output now displays column headings from the TITLE_ES attributes where they exist (Product Number and Product Name). Where no Spanish title is specified (the Price field), the column heading in the TITLE attribute appears:

<table>
<thead>
<tr>
<th>Numero de Producto:</th>
<th>Nombre de Producto:</th>
<th>Price:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1004</td>
<td>2 Hd VCR LCD Menu</td>
<td>179.00</td>
</tr>
<tr>
<td>1008</td>
<td>DVD Upgrade Unit for Cent. VCR</td>
<td>199.00</td>
</tr>
<tr>
<td>1026</td>
<td>AR3 35MM Camera 10 X</td>
<td>129.00</td>
</tr>
<tr>
<td>1028</td>
<td>AR2 35MM Camera 8 X</td>
<td>109.00</td>
</tr>
<tr>
<td>1030</td>
<td>QX Portable CD Player</td>
<td>169.00</td>
</tr>
<tr>
<td>1032</td>
<td>R5 Micro Digital Tape Recorder</td>
<td>89.00</td>
</tr>
</tbody>
</table>

\section*{Using Date System Amper Variables in Master File DEFINEs}

\textbf{Reference:}

Messages for Date System Amper Variables in Master File DEFINEs

\textbf{Example:}

Using the Date Variable \&DATE in a Master File DEFINE

Using the Date Variable \&YYMD in a Master File DEFINE

Master File DEFINE fields can use Dialogue Manager system date variables to capture the system date each time the Master File is parsed for use in a request.

The format of the returned value for each date variable is the format indicated in the variable name. For example, \&DATEYYMD returns a date value with format YYMD. The exceptions are \&DATE and \&TOD, which return alphanumeric values and must be assigned to a field with an alphanumeric format. The variable names \&DATE and \&TOD must also be enclosed in single quotation marks in the DEFINE expression.
The variables supported for use in Master File DEFINEs are:

- &DATE
- &TOD
- &DATEMDY
- &DATEDMY
- &DATEYMD
- &DATEMDYY
- &DATEDMYY
- &DATEYYMD
- &DMY
- &YMD
- &MDY
- &YYMD
- &MDYY
- &DMYY

Note that all other reserved amper variables are not supported in Master Files.

**Example:** Using the Date Variable &DATE in a Master File DEFINE

The following version of the EMPLOYEE Master File has the DEFINE field named TDATE added to it. TDATE has format A12 and retrieves the value of &DATE, which returns an alphanumeric value and must be enclosed in single quotation marks:

```plaintext
FILENAME=EMPLOYEE, SUFFIX=FOC
SEGNAMES=EMPINFO, SEGTYPE=S1
  FIELDMNAME=EMP_ID, ALIAS=EID, FORMAT=A9, $  
  FIELDMNAME=LAST_NAME, ALIAS=LN, FORMAT=A15, $  
  FIELDMNAME=FIRST_NAME, ALIAS=FN, FORMAT=A10, $  
  FIELDMNAME=HIRE_DATE, ALIAS=HDT, FORMAT=I6YMD, $  
  FIELDMNAME=DEPARTMENT, ALIAS=DPT, FORMAT=A10, $  
  FIELDMNAME=CURR_SAL, ALIAS=CSAL, FORMAT=D12.2M, $  
  FIELDMNAME=CURR_JOBCODE, ALIAS=CJC, FORMAT=A3, $  
  FIELDMNAME=ED_HRS, ALIAS=OJT, FORMAT=F6.2, $  
  DEFINE TDATE/A12 = ' &DATE ';, $  
  .  
  .  
```
The following request displays the value of TDATE:

```sql
TABLE FILE EMPLOYEE
PRINT LAST_NAME FIRST_NAME HIRE_DATE TDATE AS 'TODAY'S,DATE'
WHERE LAST_NAME EQ 'BANNING'
END
```

The output is:

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>FIRST_NAME</th>
<th>HIRE_DATE</th>
<th>TDATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>BANNING</td>
<td>JOHN</td>
<td>82/08/01</td>
<td>05/11/04</td>
</tr>
</tbody>
</table>

**Example: Using the Date Variable &YYMD in a Master File DEFINE**

The following version of the EMPLOYEE Master File has the DEFINE field named TDATE added to it. TDATE has format YYMD and retrieves the value of &YYMD:

```sql
FILENAME=EMPLOYEE, SUFFIX=FOC
SEGNAME=EMPINFO, SEGTYPE=S1
    FIELDNAME=EMP_ID, ALIAS=EID, FORMAT=A9, $
    FIELDNAME=LAST_NAME, ALIAS=LN, FORMAT=A15, $
    FIELDNAME=FIRST_NAME, ALIAS=FN, FORMAT=A10, $
    FIELDNAME=HIRE_DATE, ALIAS=HDT, FORMAT=I6YMDS, $
    FIELDNAME=DEPARTMENT, ALIAS=DPT, FORMAT=A10, $
    FIELDNAME=CURR_SAL, ALIAS=CSAL, FORMAT=D12.2M, $
    FIELDNAME=CURR_JOBCODE, ALIAS=CJC, FORMAT=A3, $
    FIELDNAME=ED_HRS, ALIAS=OJT, FORMAT=F6.2, $
DEFINE TDATE/YYMD = &YYMD ;, $
```

The following request displays the value of TDATE:

```sql
TABLE FILE EMPLOYEE
PRINT LAST_NAME FIRST_NAME HIRE_DATE TDATE AS 'TODAY'S,DATE'
WHERE LAST_NAME EQ 'BANNING'
END
```

The output is:

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>FIRST_NAME</th>
<th>HIRE_DATE</th>
<th>TDATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>BANNING</td>
<td>JOHN</td>
<td>82/08/01</td>
<td>2004/05/11</td>
</tr>
</tbody>
</table>
Reference: Messages for Date System Amper Variables in Master File DEFINEs

The following message appears if an attempt is made to use an unsupported amper variable in a Master File DEFINE:

(FOC104) DEFINE IN MASTER REFERS TO A FIELD OUTSIDE ITS SCOPE: var

CREATE FILE DROP

How to:
Issue the CREATE FILE Command With the DROP Option

Reference:
Usage Notes for CREATE FILE DROP

Example:
Creating a FOCUS Data Source That Already Exists
Creating an Oracle Table That Already Exists

The CREATE FILE command creates a data source that conforms to an existing Master File. You can use this command to create a FOCUS, XFOCUS, or relational data source.

If you issue the CREATE FILE command when the data source already exists, the following message appears for a FOCUS or XFOCUS data source:

(FOC441) WARNING. THE FILE EXISTS ALREADY. CREATE WILL WRITE OVER IT

For a relational data source, the following messages appear, followed by messages from the Relational engine indicating that the table cannot be created and then by a FOC1414 message:

(FOC1400) SQLCODE IS 955 (HEX: 000003BB)
(FOC1421) TABLE EXISTS ALREADY. DROP IT OR USE ANOTHER TABLENAME

The DROP option on the CREATE FILE command prevents the display of the messages and creates the data source, dropping the existing table first if necessary and re-parsing the Master File if it changed.

Syntax:  How to Issue the CREATE FILE Command With the DROP Option

CREATE FILE filename DROP

where:

filename

Is the Master File name for a FOCUS, XFOCUS, or relational data source.
Example: Creating a FOCUS Data Source That Already Exists

The following CREATE FILE command creates the EMPLOYEE data source, which already exists:

```
create file employee
(FOC441) WARNING. THE FILE EXISTS ALREADY. CREATE WILL WRITE OVER IT
```

REPLY :

If you reply NO, the file is not created. If you reply anything else, the file is created.

The following CREATE FILE command creates the EMPLOYEE data source, which already exists without generating the FOC441 warning or requesting a reply.

```
create file employee drop
  NEW FILE EMPLOYEE   FOCUS   A1 ON 05/12/2004 AT 16.09.14
```

Example: Creating an Oracle Table That Already Exists

The Oracle table name EMPINFO exists therefore, the following CREATE FILE command generates an error and the new version of the table is not created:

```
create file empinfo
(FOC1400) SQLCODE IS 955 (HEX: 000003BB)
(FOC1421) TABLE EXISTS ALREADY. DROP IT OR USE ANOTHER TABLENAME
  : ORA-00955: name is already used by an existing object
  : Erroneous token: EMPINFO
(FOC1414) EXECUTE IMMEDIATE ERROR.
```

The following CREATE FILE command drops the existing table and creates a new version:

```
create file empinfo drop
>
```
The SQLDI trace shows that the original version of the table is dropped and then the new version is created:

```sql
SET TRACEUSER = ON
SET TRACEOFF = ALL
SET TRACEON = SQLDI//CLIENT
create file empinfo drop

**** orafoc: gfun: 3, fun: 2, cnum: 0
**** orafoc: gfun: 1, fun: 6, cnum: 0
**** Local server assigned for operation
**** OOPEN call
**** OOPEN return
**** acda=008DC0C8,ocnum=1,retcode=0
**** OPARSE call
**** 1 of sql cmd  20
SQL:  DROP TABLE EMPINFO

**** OEXEC return
```
Reference: Usage Notes for CREATE FILE DROP

If you issue the CREATE FILE filename DROP command for a FOCUS or XFOCUS data source that has an external index or MDI, you must REBUILD the index after creating the data source.
**COMPUTE in a Master File**

**How to:**
Include a COMPUTE Command in a Master File

**Reference:**
Usage Notes for COMPUTE in a Master File

**Example:**
Coding a COMPUTE in the Master File and Accessing the Computed Value

COMPUTE commands can be included in Master Files and referenced in subsequent TABLE requests, enabling you to build expressions once and use them in multiple requests.

**Syntax: How to Include a COMPUTE Command in a Master File**

```plaintext
COMPUTE fieldname/fmt=expression;
```

where:

- `fieldname`
  Is name of the calculated field.

- `fmt`
  Is the format and length of the calculated field.

- `expression`
  Is the formula for calculating the value of the field.

**Reference: Usage Notes for COMPUTE in a Master File**

In all instances, COMPUTEs in the Master File have the same functionality and limitations as temporary COMPUTEs. Specifically, fields computed in the Master File must follow these rules:

- They cannot be used in JOIN, DEFINE, or ACROSS phrases, or with prefix operators.
- When used as selection criteria, syntax is either IF TOTAL field or WHERE TOTAL field.
- When used as sort fields, syntax is BY TOTAL COMPUTE field.
- To insert a calculated value into a heading or footing, you must reference it prior to the HEADING or FOOTING command.
Example:  Coding a COMPUTE in the Master File and Accessing the Computed Value

Use standard COMPUTE syntax to add a calculated value to your Master File. You can then access the calculated value by referencing the computed fieldname in subsequent TABLE requests. When used as a verb object, as in the following example, the syntax is SUM (or PRINT) COMPUTE field.

The following is the SALESTES Master File (the SALES FILE modified with an embedded COMPUTE):

FILENAME=SALESTES, SUFFIX=FOC,
SEGNAME=STOR_SEG, SEGTYPE=S1,
  FIELDNAME=STORE_CODE, ALIAS=SNO, FORMAT=A3, $
  FIELDNAME=CITY, ALIAS=CTY, FORMAT=A15, $
  FIELDNAME=AREA, ALIAS=LOC, FORMAT=A1, $
SEGNAME=DATE_SEG, PARENT=STOR_SEG, SEGTYPE=SH1,
  FIELDNAME=DATE, ALIAS=DTE, FORMAT=A4MD, $
SEGNAME=PRODUCT, PARENT=DATE_SEG, SEGTYPE=S1,
  FIELDNAME=PROD_CODE, ALIAS=PCODE, FORMAT=A3, FIELDTYPE=I, $
  FIELDNAME=UNIT_SOLD, ALIAS=SOLD, FORMAT=I5, $
  FIELDNAME=RETAIL_PRICE, ALIAS=RP, FORMAT=D5.2M, $
  FIELDNAME=DELIVER_AMT, ALIAS=SHIP, FORMAT=I5, $
  FIELDNAME=OPENING_AMT, ALIAS=INV, FORMAT=I5, $
  FIELDNAME=RETURNS, ALIAS=RTN, FORMAT=I3, MISSING=ON, $
  FIELDNAME=DAMAGED, ALIAS=BAD, FORMAT=I3, MISSING=ON, $
COMPUTE REVENUE/D12.2M=UNIT_SOLD*RETAIL_PRICE;

In the TABLE request, computed field, REVENUE, is a verb object of SUM.

TABLE FILE SALESTES
HEADING CENTER
"NEW YORK PROFIT REPORT"
""
SUM UNIT_SOLD AS 'UNITS,SOLD' RETAIL_PRICE AS 'RETAIL_PRICE' COMPUTE REVENUE;
BY PROD_CODE AS 'PROD,CODE'
WHERE CITY EQ 'NEW YORK'
END
The output is:

NEW YORK PROFIT REPORT

<table>
<thead>
<tr>
<th>PROD CODE</th>
<th>UNITS SOLD</th>
<th>RETAIL_PRICE</th>
<th>REVENUE</th>
</tr>

</tbody>
</table>

**Comma-delimited Access File**

**How to:**
Create an Access File

**Reference:**
Access File Attributes for Comma-Delimited Access Files

**Example:**
Access File for the VIDEOTR2 Data Source

Starting in Version 7.6.5, a comma-delimited Access File has been implemented for FOCUS and XFOCUS data sources.

The Access File for a FOCUS or XFOCUS data source is needed to implement intelligent partitioning or to access a Multi-dimensional index (MDI). You can also use it to specify the data set names for location segments.

In prior releases, the Access File for a FOCUS data source was space delimited and could describe the files associated with several Master Files. The name of the Access File was arbitrary and was specified with the ACCESS = attribute in the Master File.

The new syntax is comma-delimited, similar to the Master File syntax. It can describe the files needed for accessing only one Master File. The name of the Access File must be the same as the Master File name, and it must be specified with the ACCESS = attribute in the Master File.

Both types of syntax are supported in the FOCUS 7.6 track, but starting with FOCUS 7.7, only the comma-delimited syntax will be supported.
Comma-delimited Access File

Every request supplies the name of a Master File. The Master File is read and the declarations in it are used to access the data source. If the Master File contains an ACCESS= attribute that references an Access File, the Access File is read and used to locate the correct data sources. With the comma-delimited syntax, the Access File must have the same name as the Master File. With the space-delimited syntax, the Access File can have any name. If there is no Access File with the same name as the ACCESS= attribute in the Master File, the request is processed with the Master File alone.

An Access File is required to take advantage of intelligent partitioning. Intelligent partitioning places records containing specific data values in separate physical partitions and uses the Access File to describe the values in the records in each partition. With this information, data access is optimized by retrieving only those partitions whose values are consistent with the selection criteria in the request.

Note: On z/OS, the Access File must be a member of a data set concatenated in the allocation for ddname ACCESS. On z/VM, the Access File must have the file type ACCESS. The Access File has the same DCB attributes as the Master File. On UNIX and Windows, the Access File has the extension .acx.

Reference: Access File Attributes for Comma-Delimited Access Files

Each comma-delimited Access File describes the files and MDIs for one Master File, and that Master File must have the same file name as the Access File.

All attribute/value pairs are separated by an equal sign (=), and each pair in a declaration is delimited with a comma (,). Each declaration is terminated with the comma dollar sign (,$).

1. Each Access File starts with a declaration that names its corresponding Master File.

2. Next comes the DATA declaration that describes the location of the physical file. If the file is partitioned, it has multiple DATA declarations.

   If the file is intelligently partitioned so that an expression describes which data values reside in each partition, the DATA declaration has a WHERE phrase that specifies this expression.

3. If the data source has LOCATION segments the LOCATION declaration names a location segment. Its corresponding LOCATIONDATA declaration points to the physical LOCATION file.

4. If the data source has an MDI, the Access File has an MDI declaration that names the MDI and its target segment, followed by declarations that name the dimensions of the MDI, followed by the MDIDATA declaration that points to the physical MDI file. If the MDI is partitioned, there are multiple MDIDATA declarations for the MDI.
Syntax: How to Create an Access File

Master File declaration:

MASTER=mastername,$

where:

mastername

Indicates the name of the Master File with which this Access File is associated. It is the same value included in the Master File ACCESS=filename attribute, used to indicate both the existence of the Access File and its name.

DATA=file_specification,
    [WHERE= expression; ,]$[DATA=file_specification,
    [WHERE= expression; ,]$ ...

where:

file_specification

Points to the file location. This is a complete file specification. There are can be up to 250 DATA declarations (partitions) in a single Access File. With XFOCUS data sources, this supports creation of a 4 Terabyte database. Using FOCUS data sources, a 500 GB database can be constructed.

The WHERE clause is the basis of the Intelligent Partitioning feature. The expression is terminated with the semi-colon and the entire declaration with the comma/dollar sign. WHERE expressions of the following type are supported:

WHERE = field operator value1 [ OR value2...]; ,$
WHERE = field FROM value1 TO value2 [AND FROM value3 TO value4]; ,$

Expressions can be combined with the AND operator.

Location File declarations:

LOCATION=location_segment_name,$
    LOCATIONDATA=location_segment_file_specification,$

where:

location_segment_name

Is the name of the segment stored in the location file.

location_segment_file_specification

Is the full file specification for the physical file the segment is located in.
**Comma-delimited Access File**

**MDI declarations:**

```plaintext
MDI=mdiname, TARGET_OF = segname,$
   DIM = [filename.]fieldname [, MAXVALUES = n] ,$  
   [DIM = [filename.]fieldname [, MAXVALUES = n] ,$ ...
MDIDATA=mdi_file_specification,$
   [MDIDATA=mdi_file_specification,$ ...

where:

- **mdiname**
  - Is the name of the MDI.

- **segname**
  - Is the name of the target segment

- **filename**
  - Is the name of the file where an MDI dimension resides.

- **fieldname**
  - Is the name of a field that is a dimension of the MDI.

- **n**
  - Is the number of distinct values in the dimension. When the MDI is created, the actual dimension value will be converted to an integer of length 1, 2, or 4 bytes, and this number will be stored in the index leaf.

- **mdi_file_specification**
  - Is the fully-qualified specification of the physical MDI file. If the MDI is partitioned, it is the specification for one partition of the MDI. An MDI can have up to 250 MDIDATA declarations (partitions). An Access File can have an unlimited number of MDIs.
Example: Access File for the VIDEOTR2 Data Source

VIDEOTR2 is an intelligently partitioned FOCUS data source. The Master File has an ACCESS=VIDEOTR2 attribute:

```
FILENAME=VIDEOTR2, SUFFIX=FOC, ACCESS=VIDEOTR2
SEGNAME=CUST, SEGTYPE=S1
  FIELDNAME=CUSTID, ALIAS=CIN, FORMAT=A4, $
  FIELDNAME=LASTNAME, ALIAS=LN, FORMAT=A15, $
  FIELDNAME=FIRSTNAME, ALIAS=FN, FORMAT=A10, $
  FIELDNAME=EXPDATE, ALIAS=EXDAT, FORMAT=YMD, $
  FIELDNAME=PHONE, ALIAS=TEL, FORMAT=A10, $
  FIELDNAME=STREET, ALIAS=STR, FORMAT=A20, $
  FIELDNAME=CITY, ALIAS=CITY, FORMAT=A20, $
  FIELDNAME=STATE, ALIAS=PROV, FORMAT=A4, $
  FIELDNAME=ZIP, ALIAS=POSTAL_CODE, FORMAT=A9, $
  FIELDNAME=EMAIL, ALIAS=EMAIL, FORMAT=A18, $
SEGNAME=TRANSDAT, SEGTYPE=SH1, PARENT=CUST
  FIELDNAME=TRANSDATE, ALIAS=OUTDATE, FORMAT=HYYMDI, MISS=ON, $
SEGNAME=SALES, SEGTYPE=S2, PARENT=TRANSDAT
  FIELDNAME=TRANSCODE, ALIAS=TCOD, FORMAT=I3, $
  FIELDNAME=QUANTITY, ALIAS=NO, FORMAT=I3S, $
SEGNAME=RENTALS, SEGTYPE=S2, PARENT=TRANSDAT
  FIELDNAME=MOVIECODE, ALIAS=MCOD, FORMAT=A6, INDEX=I, $
  FIELDNAME=COPY, ALIAS=COPY, FORMAT=I2, $
  FIELDNAME=RETURNDATE, ALIAS=INDATE, FORMAT=YMD, $
  FIELDNAME=FEE, ALIAS=FEE, FORMAT=F5.2S, $
DEFINE DATE/I4 = HPART(TRANSDATE, 'YEAR', 'I4');$
```

The following shows the Access File, named VIDEOTR2, on z/OS:

```
MASTER=VIDEOTR2 ,$
  DATA=USER1.VIDPART1.FOCUS,
    WHERE=DATE EQ 1991;,$

DATA=USER1.VIDPART2.FOCUS,
    WHERE=DATE FROM 1996 TO 1998; ,$

DATA=USER1.VIDPART3.FOCUS,
    WHERE=DATE FROM 1999 TO 2000;, $
```
The following shows the Access File, named VIDEOTR2, on CMS:

```
MASTER=VIDEOTR2 ,$
    DATA='VIDPART1 FOCUS A',
    WHERE=DATE EQ 1991; ,$

    DATA='VIDPART2 FOCUS A',
    WHERE=DATE FROM 1996 TO 1998; ,$

    DATA='VIDPART3 FOCUS A',
    WHERE=DATE FROM 1999 TO 2000; ,$
```

1022 Partitions

Starting with Version 7.6.5, FOCUS and XFOCUS data sources can consist of up to 1022 physical files. The number of physical files associated with one FOCUS or XFOCUS data source is the sum of its partitions and LOCATION files. This sum must be less than or equal to 1022. FOCUS or XFOCUS data sources can grow in size over time, and can be re-partitioned based on the requirements of the application.

In order to concatenate multiple partitions, you must have a FOCUS Access File or a USE command. Both of these now support up to 1022 files for a data source. For complete information about partitioning a data source and creating an Access File, see the Describing Data manual.

Reference: Usage Notes for 1022 Partitions

The following guidelines apply:

- Concatenation of multiple partitions is supported for reporting only.
- The total number of files in a join structure can be up to 1022 counting all host and cross-referenced partitions.
- There is no increase to the number of external index or MDI partitions. They are limited to 240 partitions.
This chapter describes enhancements to the MODIFY facility.

For information about compiling MODIFY expressions using native arithmetic, see *Compiling MODIFY Expressions Using Native Arithmetic* in Chapter 1, *Performance Enhancements*.

**Topics:**
- Loading Fixed Format Sequential Files Using MODIFY
- MODIFY FIXFORM Support for Multiple Text Fields
- Controlling Whether FIXFORM Input Fields Are Conditional
Loading Fixed Format Sequential Files Using MODIFY

How to:
Load Data Into Fixed Format Sequential Files Using MODIFY

Reference:
Usage Notes for MODIFY of Fixed Format Sequential Data Sources

Example:
Loading a Fixed Format Sequential Data Source Using MODIFY
Reporting on a Fixed Format File That is Out of Sequence

You can use the MODIFY command to load data into a single segment fixed format sequential data source. This enables you to created fixed format files with specific data types that are difficult to create using the HOLD FORMAT INTERNAL command.

The data is loaded in the order in which it is input. Update and delete operations are not supported.

Syntax:  How to Load Data Into Fixed Format Sequential Files Using MODIFY

MODIFY FILE filename
readcmd
[COMPUTE field[/format1] = expression1;]
[VALIDATE testfld[/format2] = expression2;]
modify_select_and_load_cmds
DATA [ON ddname] [VIA CRTFORM]
END

where:

filename
Is the name of the fixed format sequential file to be loaded.

readcmd
Can be any supported MODIFY command for describing and reading incoming data such as CRTFORM, PROMPT, FREEFORM, or FIXFORM.

field
Can be an existing field in the data source, a temporary field, or an input field that requires calculations in order to be used in your MODIFY processing.

format1
Is the format you assign to a temporary field. Omit the format for existing fields.
**testfld**

Is a temporary field that will be used to accept or reject a transaction based on a calculation. If the value of the field is zero, the transaction will be rejected.

**format2**

Is the format you assign to the field. The format type must be numeric (I, F, D, or P). Specify the format only if you will use the field elsewhere in the request.

**expression1, expression2**

Are expressions supported in MODIFY.

**modify_select_and_load_cmds**

Can be any sequence of MODIFY commands that select transactions, such as MATCH and NEXT, as well as INCLUDE commands that load records into the data source.

**ddname**

Specifies the logical name of a data source that contains the transaction records.

For complete information about MODIFY facilities and commands, see your MODIFY documentation.

**Reference: Usage Notes for MODIFY of Fixed Format Sequential Data Sources**

- MATCH only positions to the first data source record that matches the first transaction record. To move through the file after a MATCH, use NEXT.
- The SEGTYPE is ignored when matching. Therefore, the recommended SEGTYPE is S0.
- Any NOMATCH or INCLUDE command that is executed, positions you at the end of the file.
- REPOSITION is not supported.
- Multi-segment fixed format sequential files are not supported.
- Data is loaded in the sequence in which it is input.
- If the data source already exists, new records are added at the end.
- To report on a fixed format file that is out of sequence but has a SEGTYPE that specifies one or more key fields (for example, S1 or S2), issue the SET FIXRETRIEVE=OFF command. This setting causes the entire file to be searched for records that satisfy a screening condition in the report request.
Example:  Loading a Fixed Format Sequential Data Source Using MODIFY

The following Master File describes a fixed format data source called CENTFIX. This Master File is based on the Master File for the FOCUS data source named CENTINV, with the SUFFIX changed to FIX, the SEGTYPE changed to S0, and the DEFINE fields removed:

FILE=CENTFIX, SUFFIX=FIX, FDFC=19, FYRT=00
SEGNAME=INVINFO, SEGTYPE=S0, $
FIELD=PROD_NUM, ALIAS=PNUM, FORMAT=A4, INDEX=I,
  TITLE='Product,Number:',
  DESCRIPTION='Product Number', $
FIELD=PRODNAME, ALIAS=PNAME, FORMAT=A30,
  WITHIN=PRODCAT,
  TITLE='Product,Name:',
  DESCRIPTION='Product Name', $
FIELD=QTY_IN_STOCK, ALIAS=QIS, FORMAT=I7,
  TITLE='Quantity,In Stock:',
  DESCRIPTION='Quantity In Stock', $
FIELD=PRICE, ALIAS=RETAIL, FORMAT=D10.2,
  TITLE='Price:',
  DESCRIPTION='Price', $
FIELD=cost, ALIAS=OUR_COST, FORMAT=D10.2,
  TITLE='Our,Cost:',
  DESCRIPTION='Our Cost:', $

The following procedure loads the fixed format sequential file named CENTFIX. The input data is the same as the data used to load the FOCUS data source CENTINV. However, the record for PROD_NUM '1022' has been moved out of sequence, in front of the record for PROD_NUM '1020':

```plaintext
CMS FILEDEF CENTFIX DISK CENTFIX DATA A
CREATE FILE CENTFIX
MODIFY FILE CENTFIX
FIXFORM PROD_NUM/4 PRODNAME/30 QTY_IN_STOCK/7 PRICE/12 COST/12
CHECK OFF
MATCH PROD_NUM
ON MATCH REJECT
ON NOMATCH INCLUDE
DATA
10042 Hd VCR LCD Menu               43068      179.00      129.00
1006Combo Player - 4 Hd VCR + DVD   13527      399.00      289.00

1020150 8MM Camcorder 20 X         5961        319.00      240.00
1024110 VHS-C Camcorder 20 X       4000        349.00      249.00
1026AR3 35MM Camera 10 X           12444      129.00       95.00
1028AR2 35MM Camera 8 X            11499      109.00       79.00
1030QX Portable CD Player          22000      169.00       99.00
1032R5 Micro Digital Tape Recorder 1990        89.00       69.00
1034ZT Digital PDA - Commercial    21000      499.00      349.00
1036ZC Digital PDA - Standard      33000      299.00      249.00
END
```

The following messages indicate that the data was loaded:

```
CENTFIX FIX       ON 07/14/2006 AT 10.17.05
(FOC1291) RECORDS AFFECTED DURING CURRENT REQUEST : 17/INSERT
TRANSACTIONS:    TOTAL = 17 ACCEPTED= 17 REJECTED= 0
SEGMENTS:        INPUT = 17 UPDATED = 0 DELETED = 0
```

The following request reports from the CENTFIX fixed format file:

```plaintext
CMS FILEDEF CENTFIX DISK CENTFIX DATA A
TABLE FILE CENTFIX
SUM PRODNAME PRICE COST
BY PROD_NUM
END
```
### Example: Reporting on a Fixed Format File That is Out of Sequence

The CENTFIX data source was loaded with the record for PROD_NUM '1022' before the record for PROD_NUM '1020'. This does not cause a problem for reporting if the SEGTYPE is S0.

However, if the SEGTYPE for CENTFIX is S1, PROD_NUM is considered the key field, and is a candidate for keyed retrieval. Keyed retrieval assumes that the records are in order of the key field. If a value higher than the requested value is found in the data source, it is assumed that no record exists with the requested value, and retrieval halts.

**Note:** The SEGTYPE would be S1 if CENTFIX had been created as a HOLD file based on the CENTINV data source, and if the Master File had not been manually edited to change the SEGTYPE value.

Consider the following request that prints the record in which PROD_NUM equals '1020' and in which FIXRETRIEVE is ON (the default value):

```
TABLE FILE CENTFIX
PRINT PROD_NUM PRODNAME PRICE COST
WHERE PROD_NUM EQ '1020'
ON TABLE SET FIXRETRIEVE ON
END
```
The equality test does not retrieve the record with PROD_NUM='1020' because the keyed retrieval assumes the records are in order of the key field and stops searching when the record for PROD_NUM '1022' is found:

```
NUMBER OF RECORDS IN TABLE=        0  LINES=      0
```

Running the request with FIXRETRIEVE OFF retrieves the requested record even though it is out of sequence:

```sql
TABLE FILE CENTFIX
PRINT PROD_NUM PRODNAME PRICE COST
WHERE PROD_NUM EQ '1020'
ON TABLE SET FIXRETRIEVE OFF
END
```

The output is:

<table>
<thead>
<tr>
<th>Product Number:</th>
<th>Product Name:</th>
<th>Our Price:</th>
<th>Our Cost:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1020</td>
<td>150 8MM Camcorder 20 X</td>
<td>319.00</td>
<td>240.00</td>
</tr>
</tbody>
</table>

### MODIFY FIXFORM Support for Multiple Text Fields

**How to:**

- Load Multiple Text Fields Using a FIXFORM Field List
- Load Multiple Text Fields Using a HOLD File With FIXFORM

**Example:**

Loading Multiple Text Fields Using FIXFORM FROM HOLD

MODIFY FIXFORM can load multiple text fields into a data source. The data source must have a Write data adapter that supports MODIFY, and the data source must support text fields. In the case of Relational data sources, long varchar fields are mapped as text fields in the Master File. Support for this feature with a relational data adapter is dependent on whether the specific relational engine supports multiple long varchar columns.

The text fields must be the last fields in the FIXFORM field list and *may not* be conditional transaction fields. In the file, each text field must be terminated by a %$ character combination on a line by itself.

If the data to be loaded is from a HOLD file, the text fields must also be the last fields in the HOLD file. However, the text fields can be loaded anywhere in the receiving data source.
MODIFY FIXFORM Support for Multiple Text Fields

Syntax:  **How to Load Multiple Text Fields Using a FIXFORM Field List**

```
FIXFORM field1/fmt1 ... fieldn/fmtn txtfld1/TX ... txtfldn/TX
```

where:

- `field1 ... fieldn`  
  Are non-text fields.

- `fmt1 ... fmtn`  
  Are the format specifications for the non-text fields.

- `txtfld1 ... txtfldn`  
  Are text fields.

- `TX`  
  Is the format specification for the text fields.

Syntax:  **How to Load Multiple Text Fields Using a HOLD File With FIXFORM**

```
FIXFORM FROM ddname
```

where:

- `ddname`  
  Is the AS name used to create the HOLD file. If no AS phrase was specified in the HOLD command, the ddname is HOLD.

Example:  **Loading Multiple Text Fields Using FIXFORM FROM HOLD**

This example uses the COURSES data source, which contains a text field, to create a HOLD file with three text fields. It then uses this HOLD file to load data into the TEXT3 data source.

The following request creates the HOLD file:

```
SET ASNAMES=ON
TABLE FILE COURSES
PRINT COURSE_CODE DESCRIPTION AS 'DESCRIPTION1'
DESCRIPTION/TX25 AS 'DESCRIPTION2'
DESCRIPTION/TX100 AS 'DESCRIPTION3'
ON TABLE HOLD FORMAT ALPHA
END
```
The following is the Master File for the TEXT3 data source:

```
FILE=TEXT3 ,SUFFIX=FOC
SEGNAME=SEG1,SEGTYPE=S1
FIELDNAME  =COURSE_CODE        ,CCODE       ,A6            ,$
FIELDNAME  =DESCRIPTION1       ,DESC1       ,TX50          ,$
FIELDNAME  =DESCRIPTION2       ,DESC2       ,TX25          ,$
FIELDNAME  =DESCRIPTION3       ,DESC3       ,TX100         ,$
```

The following procedure loads the TEXT3 data source:

```
CREATE FILE TEXT3
MODIFY FILE TEXT3
FIXFORM FROM CRSEHOLD
DATA ON CRSEHOLD
END
```

The following messages indicate that the data was loaded:

```
NEW FILE TEXT3   FOCUS   A1 ON 06/04/2004 AT 16.02.18
>
TEXT3   FOCUS   A1 ON 06/04/2004 AT 16.02.18
TRANSACTIONS:         TOTAL =     3  ACCEPTED=     3  REJECTED=     0
SEGMENTS:             INPUT =     3  UPDATED =     0  DELETED =     0
>
```
The following request prints the second text field from the data source:

```plaintext
TABLE FILE TEXT3
PRINT DESCRIPTION2
BY COURSE_CODE
ON COURSE_CODE SKIP-LINE
END
```

The output is:

<table>
<thead>
<tr>
<th>COURSE_CODE</th>
<th>DESCRIPTION2</th>
</tr>
</thead>
<tbody>
<tr>
<td>101</td>
<td>This course provides the DP professional with the skills needed to create, maintain, and report from FOCUS databases.</td>
</tr>
<tr>

</table>

**Controlling Whether FIXFORM Input Fields Are Conditional**

**How to:**

Control Whether FIXFORM Input Fields Are Conditional

**Reference:**

Usage Notes for SET FIXFRMINPUT

**Example:**

Controlling Whether FIXFORM Transaction Fields Are Conditional

In MODIFY, by default, FIXFORM FROM `mastername` treats all transaction data as conditional, meaning that space-filled fields are considered not present, and as such cannot be updated or used in updates.
The SET FIXFRMINPUT command enables you to specify how to handle FIXFORM input fields as either conditional (field/format C) or non-conditional fields. Thus, spaces in a transaction field can be used for updating database fields.

**Syntax:** How to Control Whether FIXFORM Input Fields Are Conditional

```
SET FIXFRMINPUT = {COND|NONCOND}
```

where:

**COND**
- Treats all transaction fields generated by FIXFORM FROM mastername as conditional (format C) fields. COND is the default value.

**NONCOND**
- Treats all transaction fields as present in the transaction, and their contents are treated as real values.

Note that if you have not changed the value of the FIXFRMINPUT parameter and you query its value, the value displays as DEFAULT.

**Reference: Usage Notes for SET FIXFRMINPUT**

- The FIXFRMINPUT setting does not affect a FIXFORM command that does not have a FROM phrase.
- If you run a compiled MODIFY, its behavior reflects the FIXFRMINPUT setting at the time it was compiled, even if a different setting is in effect at run time.

**Example:** Controlling Whether FIXFORM Transaction Fields Are Conditional

The following procedure establishes a transaction file, defining LN1 in HOLD file TRANS to be blank for PIN 000000040.

```
SET ASNAMES = ON
DEFINE FILE EMPDATA
LN1/A15 = IF PIN EQ '000000040' THEN '' ELSE LN;
END
TABLE FILE EMPDATA
PRINT PIN LN1 AS LN
IF PIN FROM '000000010' TO '000000100'
ON TABLE HOLD AS TRANS
END
```
The following procedure, sets the FIXFORM FROM input fields as conditional (the default) and reports on the output from the MODIFY:

```
SET FIXFRMINPUT = COND
?- SET FIXFRMINPUT &FIXF

MODIFY FILE EMPDATA
  FIXFORM FROM TRANS
  MATCH PIN
    ON MATCH UPDATE LN
    ON NOMATCH REJECT
  DATA ON TRANS
END

TABLE FILE EMPDATA
  HEADING
    " "
    "VALUE OF FIXFRMINPUT IS &FIXF "
    " "
  PRINT PIN LN
    IF PIN FROM '000000010' TO '000000100'
END

The output shows that the blank in the transaction file was not used to update the last name in the data source:

  VALUE OF FIXFRMINPUT IS COND

<table>
<thead>
<tr>
<th>PIN</th>
<th>LASTNAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>000000010</td>
<td>VALINO</td>
</tr>
<tr>
<td>000000020</td>
<td>BELLA</td>
</tr>
<tr>
<td>000000030</td>
<td>CASSANOVA</td>
</tr>
<tr>
<td>000000040</td>
<td>ADAMS</td>
</tr>
<tr>
<td>000000050</td>
<td>ADDAMS</td>
</tr>
<tr>
<td>000000060</td>
<td>PATEL</td>
</tr>
<tr>
<td>000000070</td>
<td>SANCHEZ</td>
</tr>
<tr>
<td>000000080</td>
<td>SO</td>
</tr>
<tr>
<td>000000090</td>
<td>PULASKI</td>
</tr>
<tr>
<td>000000100</td>
<td>ANDERSON</td>
</tr>
</tbody>
</table>
The following procedure sets the FIXFORM FROM input fields as non-conditional and reports on the output from the MODIFY:

```
SET FIXFRMINPUT = NONCOND
-? SET FIXFRMINPUT &FIXF
```

```
MODIFY FILE EMPDATA
  FIXFORM FROM TRANS
  MATCH PIN
    ON MATCH UPDATE LN
    ON NOMATCH REJECT
  DATA ON TRANS
END

TABLE FILE EMPDATA
  HEADING
    " "
    "VALUE OF FIXFRMINPUT IS &FIXF "
    " "
  PRINT PIN LN
    IF PIN FROM '000000010' TO '000000100'
END
```

The output shows that the last name for PIN 000000040 has been updated to contain blanks:

```
VALUE OF FIXFRMINPUT IS NONCOND
```

```
PIN    LASTNAME
---    ---------
000000010  VALINO
000000020  BELLA
000000030  CASSANOVA
000000040
000000050  ADDAMS
000000060  PATEL
000000070  SANCHEZ
000000080  SO
000000090  PULASKI
000000100  ANDERSON
```
This chapter describes new features that affect FOCUS adapters (Interfaces).

**Topics:**
- Adabas Dynamic CALLTYPE Setting
- Adabas FETCHJOIN Setting
- Adabas SQL NULL Option
- PASSRECS Setting for Adapters for Adabas, IMS, and VSAM
- VSAM RRDS Support
- HOLD FORMAT SAME_DB
- Adapter for Oracle: Increased Length of Column Descriptions
- Oracle 10g Support
- Relational Adapters: Controlling Optimization of Calculations
- Calling a Teradata Macro or Stored Procedure Using SQL Passthru
Adabas Dynamic CALLTYPE Setting

Example: Using Dynamic CALLTYPE

The SET CALLTYPE command enables you to set the data retrieval type per session, file, or segment by switching dynamically between physical and logical reads.

Example: Using Dynamic CALLTYPE

The following examples illustrate the use of variations of dynamic CALLTYPE syntax:

ENGINE ADBSINX SET CALLTYPE FIND
- Uses FIND as the type of data retrieval call for all files.

ENGINE ADBSINX SET CALLTYPE RL AFD EMPFILE
- Retrieves data for the EMPFILE using RL as the type of data retrieval call.
  Note that you can issue several commands for different files. Each command must be issued separately. Changes are cumulative. For example, the following commands retrieve data for the EMPFILE using FIND as the type of data retrieval call for a particular ADBS segment (segment S02):

  ENGINE ADBSINX SET CALLTYPE RL AFD EMPFILE
  ENGINE ADBSINX SET CALLTYPE FIND AFD EMP2
  ENGINE ADBSINX SET CALLTYPE MIXED AFD VEHICLES
  ENGINE ADBSINX SET CALLTYPE FIND AFD EMPFILE SEGNAME S02

ENGINE ADBSINX SET ?
- Displays your settings.

ENGINE ADBSINX SET CALLTYPE DEFAULT
- Returns to the default settings. This command resets all SET CALLTYPE commands for all Access Files.

Adabas FETCHJOIN Setting

How to: Set Adabas FETCHJOIN

You can use the FETCHJOIN command to take advantage of Multifetch efficiencies in Join operations for a session. This feature is particularly useful when you are joining to a base file in which sorting is based on the key field that is used for the join.
**Syntax:** How to Set Adabas FETCHJOIN

```
ENGINE ADBSINX SET FETCHJOIN {ON | OFF}
```

where:

- **ADBSINX**
  Indicates the Adapter for Adabas.

- **ON**
  Sets the FETCHJOIN feature on for the user session. ON is the default value.

- **OFF**
  Sets the FETCHJOIN feature off for the user session. This value is recommended when joining with a base file that is unsorted by the key field used for joining. This option avoids buffering and reduces processing time.

---

**Adabas SQL NULL Option**

**Example:**

Using the SQL NULL Option

Adabas includes two data definition options, Not Counted (NC) and Not Null or Null Value Not Allowed (NN), for providing SQL-compatible null representation for Software AG’s mainframe Adabas SQL Server (ESQ) and other Structured Query Language (SQL) database query languages.

The NC and NN options cannot be applied to fields defined:

- With Adabas null suppression (NU).
- With a fixed-point data type (FI).
- With multiple-values (MU).
- Within a periodic group.
- As group fields.

**NC: SQL Null Value Option**

Without the Not Counted (NC) option, a null value is either zero or blank depending on the field format.

With the NC option, zeros or blanks specified in the record buffer are interpreted according to the "null indicator" value: either as true zeros or blanks (that is, as "significant" nulls) or as undefined values (that is, as true SQL or "insignificant" nulls).

If the field defined with the NC option has no value specified in the record buffer, the field value is always treated as an SQL null.
Note: On the mainframe platform, subdescriptors and superdescriptors defined with NC=YES and MISSING=ON parameters cannot be used to search for the SQL NULL value, as that causes an Adabas RC 61.

NN: SQL Not Null Option

The Not Null or Null Value Not Allowed (NN) option may only be specified when the NC option is also specified for a data field. The NN option indicates that an NC field must always have a value (including zero or blank) defined; it cannot contain "no value".

Example: Using the SQL NULL Option

If a field with the NC option does not have the NN option, then the parameter MISSING=ON is also added to the field definition in the Master File. Subdescriptors and superdescriptors derived from this field will be defined as the fields with the following options: TYPE=NOF, NC=YES, and MISSING=ON. No component fields will be associated with these subdescriptors and superdescriptors.

Sample Master File and Access File contents with the NC option:

Master File:

FILENAME=ADANC1, SUFFIX=ADBSINX, $ 
SEGMENT=S01, SECTYPE=S0, $ 
  FIELDNAME=AA_FIELD, ALIAS=AA, USAGE=I6, ACTUAL=I2, FIELDTYPE=I, $

$ $$$$$$$$$$$$$$$$$$$$$$ Subdescriptor $$$$$$$$$$$$$$$$$$$$$$$$$$$ $ 
  FIELDNAME=S4_FIELD, ALIAS=S4, USAGE=A1, ACTUAL=A1, FIELDTYPE=I, $ 
$
### Access File:

```plaintext
RELEASE=6, OPEN=YES, $
SEGNAME=S01, ACCESS=ADBS, FILENO=120, DBNO=3, CALLTYPE=FIND,
   UNQKEYNAME=AA_FIELD, WRITE=YES, $
$   CALLTYPE=RL ,SEQFIELD=AA_FIELD
$ $   CALLTYPE=RL ,SEQFIELD=AA_FIELD
$ FIELD=AA_FIELD ,TYPE=DSC ,NC= ,$
FIELD=AB_FIELD, TYPE=DSC, NC=YES, $
FIELD=AC_FIELD, TYPE=DSC, NC=YES, $
FIELD=AD_FIELD, TYPE=, NC=YES, $
FIELD=AE_FIELD, TYPE=, NC=YES, $
FIELD=BA_FIELD ,TYPE=DSC ,NC= ,$
FIELD=BB_FIELD, TYPE=DSC, NC=YES, $
FIELD=BC_FIELD, TYPE=DSC, NC=YES, $
FIELD=BD_FIELD, TYPE=, NC=YES, $
FIELD=BE_FIELD, TYPE=, NC=YES, $
FIELD=CB_FIELD, TYPE=, NC=YES, $
FIELD=CC_FIELD, TYPE=, NC=YES, $
FIELD=S1_FIELD, TYPE=NOP, NC=YES, $
FIELD=S2_FIELD, TYPE=NOP, NC=YES, $
FIELD=S3_FIELD, TYPE=NOP, NC=YES, $
FIELD=S4_FIELD, TYPE=NOP, NC=YES, $
```

**Note:** The following processing rules apply for fields defined with the NC=YES and MISSING=ON parameters:

- The default value is set to the SQL NULL value when a new record is created:

  ```sql
  INSERT INTO ADANC1
    (AA_FIELD, AB_FIELD, AC_FIELD,
     BA_FIELD, BC_FIELD, BE_FIELD,
     CA_FIELD, CC_FIELD)
  VALUES (21, 22, 23, 'B1', 'B3', 'B5','A2', 'C2');
  END
  ```

- The value could be set to the SQL NULL value when a record is updated:

  ```sql
  UPDATE ADANC1 SET AB_FIELD=NULL
  WHERE  AA_FIELD = 21;
  END
  ```
These fields can be used in search criteria for selecting records that either have or do not have SQL NULL values, as in the following examples:

```sql
SELECT AA_FIELD, AB_FIELD, AC_FIELD, AD_FIELD, AE_FIELD FROM ADANC1
WHERE  AB_FIELD IS NULL AND AA_FIELD GE 10;
END
```

```sql
SELECT AA_FIELD, AB_FIELD, AC_FIELD, AD_FIELD, AE_FIELD FROM ADANC1
WHERE  AB_FIELD IS NOT NULL;
END
```

```sql
TABLE FILE ADANC1R
  PRINT AA_FIELD AB_FIELD AC_FIELD AD_FIELD AE_FIELD G1_GROUP
  WHERE  AB_FIELD EQ MISSING;
END
```

Subdescriptors and superdescriptors can be used only in search criteria. Their values cannot be reported. Here are several examples:

```sql
SELECT AA_FIELD, AB_FIELD, AC_FIELD, AD_FIELD, AE_FIELD FROM ADANC1
WHERE  S1_FIELD = 'A1A2A4' AND AA_FIELD > 10;
END
```

```sql
SELECT AA_FIELD, AB_FIELD, AC_FIELD, AD_FIELD, AE_FIELD FROM ADANC1
WHERE  S1_FIELD IS NOT NULL AND AA_FIELD > 10;
END
```

**Note:** On the mainframe platform, subdescriptors and superdescriptors defined with the NC=YES and MISSING=ON parameters cannot be used to search for an SQL NULL value, as that causes an Adabas RC 61.
PASSRECS Setting for Adapters for Adabas, IMS, and VSAM

PASSRECS returns the number of rows affected by a successfully executed SQL Passthru INSERT, UPDATE, or DELETE command.

Syntax: How to Obtain the Number of Rows Inserted, Updated, or Deleted

ENGINE INT SET PASSRECS {ON | OFF}

where:

INT

Indicates that the PASSRECS setting in this command will be applied globally to all adapters that support SQL INSERT, UPDATE, and DELETE commands.

ON

Provides the number of rows affected in the application program SCB count member after the successful execution of an SQL Passthru INSERT, UPDATE, or DELETE command. ON is the default value.

OFF

Provides no information after the successful execution of an SQL Passthru INSERT, UPDATE, or DELETE command.

In addition, the adapter updates the &RECORDS system variable with the number of rows affected. You can access this variable using Dialogue Manager.

VSAM RRDS Support

How to:

Enable VSAM RRDS Support

Example:

Applying RRN Key Values When Working With Records in VSAM RRDS Files

The Adapter for VSAM supports both direct and sequential retrieval of fixed- and variable-length records from RRDS files, as well as modification of those records. RRDS files are VSAM files that are accessed through Relative Record Number keys (RRNs) and are processed in basically the same manner as key-sequenced (KSDS or KSEQ) VSAM files.

The RRN field that serves as the primary (unique) key for the segment follows all real fields in the physical root segment of the Master File and establishes the sequence for the records. The RRN field description must contain the following attributes:

ALIAS=RRN, USAGE=I10, ACTUAL=I4
Records in RRDS files are processed sequentially if the request does not provide a screening condition or join for the RRN-associated field.

**Syntax:**  
**How to Enable VSAM RRDS Support**

FILE=RRDSVSAM, SUFFIX=VSAM, DATASET=PGMYAN.RRDSVSAM.CLUSTER, $  
SEGNAME=ROOT ,SEGTYPE=S0 ,$  
FIELD=CODE , ,USAGE=A2 ,ACTUAL=A2 ,$  
FIELD=NAME , ,USAGE=A10 ,ACTUAL=A10 ,$  
FIELD=VALUE , ,USAGE=P2 ,ACTUAL=Z1 ,$  
FIELD=ACCESS_KEY ,ALIAS=RRN ,USAGE=I10 ,ACTUAL=I4 ,$

**Example:**  
**Applying RRN Key Values When Working With Records in VSAM RRDS Files**

The following examples show how to view and apply unique Relative Record Number (RRN) key values when working with records in RRDS files.

**Printing the records with their key values**

TABLE FILE RRDSVSAM  
PRINT CODE NAME VALUE ACCESS_KEY  
END

**Screening records by unique key values**

TABLE FILE RRDSVSAM  
PRINT CODE NAME VALUE ACCESS_KEY  
IF ACCESS_KEY GE 5  
IF ACCESS_KEY LE 15  
END

**Retrieving records by unique key values**

TABLE FILE RRDSVSAM  
PRINT CODE NAME VALUE ACCESS_KEY  
IF ACCESS_KEY EQ 5 OR 7 OR 9  
END

**Modifying records by unique key values**

MODIFY FILE RRDSVSAM ECHO  
FREEFORM ACCESS_KEY  
MATCH ACCESS_KEY  
ON NOMATCH COMPUTE CODE = 'A1';  
ON NOMATCH COMPUTE NAME = 'RECORD 20';  
ON NOMATCH INCLUDE  
ON MATCH REJECT  
DATA  
ACCESS_KEY=20  
END
Updating matching records in RRDS files by unique key values

MODIFY FILE RRDSVSAM ECHO
FREEFORM ACCESS_KEY
MATCH ACCESS_KEY
ON NOMATCH REJECT
ON MATCH
  TYPE "CODE: <D.CODE>, NAME: <D.NAME>, VALUE: <D.VALUE>";
ON MATCH COMPUTE VALUE = 9;
ON MATCH UPDATE VALUE
DATA
  ACCESS_KEY=20
END

Deleting RRDS records based on unique key values

MODIFY FILE RRDSVSAM ECHO
FREEFORM ACCESS_KEY
MATCH ACCESS_KEY
ON NOMATCH REJECT
ON MATCH
  TYPE "CODE: <D.CODE>, NAME: <D.NAME>, VALUE: <D.VALUE>";
ON MATCH DELETE
DATA
  ACCESS_KEY=7
END

**HOLD FORMAT SAME_DB**

**In this section:**
- Column Names in the HOLD File
- Primary Keys and Indexes in the HOLD File

**How to:**
- Save Report Output as a Temporary Table

**Reference:**
- Temporary Table Properties for SAME_DB Persistence Values

You can create a report output file—that is, a HOLD file—as a native DBMS temporary table. This increases performance by keeping the entire reporting operation on the DBMS server, instead of downloading data to your computer and then back to the DBMS server.

For example, if you temporarily store report output for immediate use by another procedure, storing it as a temporary table instead of creating a standard HOLD file avoids the overhead of transmitting the interim data to your computer.
The temporary table columns are created from the following report elements

- Display columns
- Sort (BY) columns
- COMPUTE columns

except for those for which NOPRINT is specified.

The temporary table that you create from your report will be the same data source type (that is, the same DBMS) as the data source from which you reported. If the data source from which you reported contains multiple tables, all must be of the same data source type and reside on the same instance of the DBMS server.

You can choose between several types of table persistence.

You can create extract files as native DBMS tables with the following adapters:

- DB2
- Oracle
- Teradata

**Syntax: How to Save Report Output as a Temporary Table**

The syntax to save report output as a native DBMS temporary table is

```
ON TABLE HOLD [AS filename] FORMAT SAME_DB [PERSISTENCE persistValue]
```

where:

- `filename`
  Specifies the name of the HOLD file. If you omit `AS filename`, the name of the temporary table defaults to “HOLD”.

Because each subsequent HOLD command overwrites the previous HOLD file, it is recommended to specify a name in each request to direct the extracted data to a separate file, thereby preventing an earlier file from being overwritten by a later one.

**PERSISTENCE**

Specifies the type of table persistence and related table properties. This is optional for DBMSs that support volatile tables, and required otherwise. For information about support for volatile tables for a particular DBMS, see *Temporary Table Properties for SAME_DB Persistence Values*, and consult your DBMS vendor’s documentation.
**persistValue**

Is one of the following:

**VOLATILE**

Specifies that the table is local to the DBMS session. A temporary synonym—a Master File and Access File—is generated automatically; it expires when the server session ends.

This is the default persistence setting for all DBMSs that support volatile tables. For information about support for the volatile setting, and about persistence and other table properties, for a particular DBMS, see *Temporary Table Properties for SAME_DB Persistence Values*, and consult your DBMS vendor’s documentation.

**GLOBAL_TEMPORARY**

Specifies that while the table exists, its definition will be visible to other database sessions and users though its data will not be. A permanent synonym—a Master File and Access File—is generated automatically.

For information about support for the global temporary setting, and about persistence and other table properties, for a particular DBMS, see *Temporary Table Properties for SAME_DB Persistence Values*, and consult your DBMS vendor’s documentation.

**PERMANENT**

Specifies that a regular permanent table will be created. A permanent synonym—a Master File and Access File—is generated automatically.
Reference: Temporary Table Properties for SAME_DB Persistence Values

The following chart provides additional detail about persistence and other properties of temporary tables of different data source types that are supported for use with HOLD format SAME_DB.

<table>
<thead>
<tr>
<th>DBMS</th>
<th>VOLATILE</th>
<th>GLOBAL_TEMPORARY</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2</td>
<td>DB2: a volatile table is created using the DECLARE GLOBAL TEMPORARY TABLE command with the ON COMMIT PRESERVE ROWS option. Declared global temporary tables persist and are visible only within the current session (connection). SESSION is the schema name for all declared global temporary tables.</td>
<td>DB2 Release 7.1 and up for z/OS only: a global temporary table is created using the CREATE GLOBAL TEMPORARY TABLE command. The definition of a created global temporary table is visible to other sessions, but the data is not. The data is deleted at the end of each transaction (COMMIT or ROLLBACK command). The table definition persists after the session ends.</td>
</tr>
<tr>
<td>Oracle</td>
<td>This type of table is not supported by Oracle.</td>
<td>The table’s definition is visible to all sessions; its data is visible only to the session that inserts data into it. The table’s definition persists for the same period as the definition of a regular table.</td>
</tr>
<tr>
<td>Teradata</td>
<td>A volatile table definition and data are visible only within the session that created the table and inserted the data. The volatile table is created with the ON COMMIT PRESERVE ROWS option.</td>
<td>A global temporary table persists for the same duration as a permanent table. The definition is visible to all sessions, but the data is visible only to the session that inserted the data. The global temporary table is created with the ON COMMIT PRESERVE ROWS option.</td>
</tr>
</tbody>
</table>

**Column Names in the HOLD File**

Each HOLD file column is assigned its name:

1. From the AS name specified for the column in the report request.
2. If there is no AS name specified, the name is assigned from the alias specified in the synonym. (The alias is identical to the column name in the original relational table.)
3. In all other cases, the name is assigned from the field name as it is specified in the synonym.

Primary Keys and Indexes in the HOLD File

A primary key or an index is created for the HOLD table. The key or index definition is generated from the sort (BY) keys of the TABLE command, except for undisplayed sort keys (that is, sort keys for which NOPRINT is specified). To determine whether a primary key or an index will be created:

1. If these sort keys provide uniqueness and do not allow nulls (that is, if in the synonym the column’s MISSING attribute is unselected or OFF), and if the DBMS supports primary keys on the type of table being created, a primary key is created.

2. If these sort keys provide uniqueness but either
   a. some of the columns allow nulls
   b. the DBMS does not support primary keys on the type of table being created then a unique index is created.

3. If these sort keys do not provide uniqueness, a non-unique index is created.

4. If there are no displayed sort keys (that is, no sort keys for which NOPRINT has not been specified), no primary key or index is created.

Adapter for Oracle: Increased Length of Column Descriptions

The adapter supports column descriptions of up to 255 characters.

Oracle 10g Support

The Adapter for Oracle now supports Oracle Release 10g. To install this version of the adapter, you must edit and submit member G10FORA in the FOCSQL.DATA data set. This member links Oracle with FOCUS.

Oracle 10g is stored in a PDSE data set. To link Oracle 10g to FOCUS, you must link it to a version of the FOCUS FOCLIB.LOAD data set that is also stored in a PDSE data set.

To run an interactive FOCUS session that accesses Oracle 10g, you must have a region size that is at least 32 megabytes.
Following is the G10FORA member of the FOCSQL.DATA data set. Add a job card, make the necessary edits, and submit this JCL to install the adapter:

//job card goes here

where:

qualif
   Is the high-level qualifier for your production FOCUS data sets.

qualpdse
   Is the high-level qualifier for your FOCUS load library in PDSE format.

oraqual
   Is the high-level qualifier for your Oracle SQL library.

libprfx
   Is the high-level qualifier for your link edit load library.

plang
   Is the linkage editor message member name.

**Relational Adapters: Controlling Optimization of Calculations**

Calculations can be processed differently in different RDBMSs and operating environments. If you want FOCUS to handle calculations instead of the RDBMS, you can issue the The SQL SET OPTIMIZATION NOAGGR command. This command disables optimization of calculations (DEFINE fields) without disabling optimization of join and sort operations.

**Syntax: **How to Disable Optimization of Calculations

```sql
SQL [engine] SET OPTIMIZATION NOAGGR
```

where:

**engine**

Indicates the target RDBMS. Valid values are DB2, SQLORA, SQLDS, SQLIDMS, or SQLDBC. You can omit this value if you previously issued the SET SQLENGINE command.
SQL Passthru is supported for Teradata macros and stored procedures.

Macros need to be developed within Teradata using the CREATE or REPLACE MACRO command. Procedures need to be developed within Teradata using the CREATE PROCEDURE command.

You must call a macro in the same transaction mode in which it was compiled. To find out which transaction mode is currently in effect, issue the HELP SESSION command:

```
SQL SQLDBC HELP SESSION;
TABLE FILE SQLOUT PRINT TRANSACTION_SEMANTICS
END
```

Before you can call a stored procedure or a macro, you must set the connection accordingly, by issuing the SET MACRO command

```
SQL SQLDBC SET MACRO {ON | OFF}
```

where:

```
ON
   Enables one to call a macro. This is the default.
OFF
   Enables one to call a stored procedure.
```

**Example:** Calling a Macro

This is an example of the syntax for calling a macro:

```
ENGINE SQLDBC
EX SAMPLE PARM1, PARM2, PARM3 . . . ;
TABLE FILE SQLOUT
END
```
### Example: Calling a Stored Procedure

The supported syntax to call a stored procedure is shown below.

```sql
ENGINE SQLDBC
EX SAMPLE PARM1, PARM2, PARM3...;
TABLE FILE SQLOUT
END
```

When using the adapter with:

- **ODBC**, all scalar parameters (IN, OUT, and INOUT) are supported.
- **CLI**, scalar IN parameters, and INOUT parameters in IN mode, are supported.

### Example: Sample Teradata Stored Procedure

```sql
CREATE OR REPLACE PACKAGE pack1 AS
  TYPE nfrectype IS RECORD (
    employee NF29005.EMPLOYEE_ID5%TYPE,
    ssn5 NF29005.SSN5%TYPE,
    l_name NF29005.LAST_NAME5%TYPE,
    f_name NF29005.FIRST_NAME5%TYPE,
    birthday NF29005.BIRTHDATE5%TYPE,
    salary NF29005.SALARY5%TYPE,
    joblevel NF29005.JOB_LEVEL5%TYPE);
  TYPE nfcurtype IS REF CURSOR RETURN nfrectype;
  PROCEDURE proc1(c_saltable IN OUT nfcurtype);
END pack1;
/
CREATE OR REPLACE PACKAGE BODY pack1 AS
  PROCEDURE proc1 (c_saltable IN OUT nfcurtype)
  IS
    BEGIN
      OPEN c_saltable FOR SELECT
          EMPLOYEE_ID5, SSN5, LAST_NAME5, FIRST_NAME5, BIRTHDATE5, SALARY5, JOB_LEVEL5
      FROM NF29005;
    END proc1; -- end of procedure
  END pack1; -- end of package body
/
```
This chapter describes limits that have been increased in this release of FOCUS.

For information on the increased number of partitions for a FOCUS or XFOCUS database, see Chapter 5, *Database Enhancements*.

**Topics:**

- Increased Number of Segments in a Structure
- Increased Length for HOLD Files in FOCUS Format
- Increased Name Length for Dialogue Manager Variables
- Increased Number of Amper Variables
- Raised Limit for Number of FML Rows
- Increased Number of Joins
- Increased Number of Files in a MATCH FILE Request
- Increased Length for DESCRIPTION Attribute in a Master File
- Increase to the Total Length of All fields
- Increased Length of DBA Passwords
- SET MAXLRECL = 65536
Increased Number of Segments in a Structure

Non-FOCUS data sources, JOIN structures used for reporting, and COMBINE structures used for MODIFY can have a maximum of 256 segments. XFOCUS data sources can have 256 segments, but when they are included in COMBINE structures used for MODIFY requests, the limit is 192 (segments plus indices).

The total number of segments in the structure includes segments defined as static cross references (SEGTYPE = KU or KM) in the Master File. Dynamic cross references (SEGTYPE = DKM, DKU, KL, or KLU) are not included in the count.

All other limits such as the number of fields in a Master File, the total length of all fields, and the number of JOINs or COMBINEs allowed are still in effect.

The number of segments in a single FOCUS data source is 64. However, FOCUS data sources can participate in JOIN or COMBINE structures with up to 256 segments. The maximum number of segments plus indices for a single FOCUS data source is 191.

Using an indexed view reduces the maximum number of segments plus indices to 191 for the structure being used. If AUTOINDEX is ON, you may be using an indexed view without specifically asking for one.

Reference: Usage Notes for 256 Segments

Maintain supports a maximum of 64 segments for all file types (FOCUS and non-FOCUS).
Increased Length for HOLD Files in FOCUS Format

Reference:
Usage Notes for HOLD FORMAT FOCUS With Unique Child Segments

Example:
Creating a FORMAT FOCUS Data Source With Unique Child Segments

A FOCUS segment cannot be longer than a FOCUS page, 3968 (4096 minus overhead) bytes. An XFOCUS segment can be up to 16K bytes. In either case, a data source path cannot be longer than 32K bytes.

In prior releases, any HOLD FORMAT FOCUS or XFOCUS request that specified more than a page of data generated the following message, and the data source was not created:

(FOC397) LENGTH OF FIELDS ON FOCUS DATA PATH EXCEEDS 32K BYTES:
The sum of the field lengths on a data source path exceeds the maximum, reduce the size or number of fields.

Now, when you create a FOCUS or XFOCUS data source using the HOLD command, data that is too long to become a single segment will become a parent segment with unique child segments. For a FOCUS data source, the fields will be grouped into normal FOCUS page size segments and added as unique segments up to the total maximum of 32K of data. For an XFOCUS data source, the root segment can hold the first 16K of data, and additional data up to the 32K total, will be placed in a single unique segment.

The FOC397 message will no longer be generated as long as the total length of the data for a segment path is less than 32K.

Each BY field in the request becomes a key in the root segment. Therefore, no BY field can be in the portion of the data placed in a unique child. If a BY field occurs in the portion of the data past the length of the root segment, the following message is generated:

(FOC400) KEY FIELDS LENGTH IN SEGMENT EXCEEDED MAXIMUM:
The key fields in the segment exceeded maximum

Reference: Usage Notes for HOLD FORMAT FOCUS With Unique Child Segments

- Addition of unique segments impacts both performance and volume.
- BY fields must all occur in the portion of the data assigned to the root segment.

For more information about HOLD FORMAT FOCUS, see the Creating Reports manual.
Example: Creating a FORMAT FOCUS Data Source With Unique Child Segments

The following request creates a version of the MOVIES data source with data longer than 3968 bytes:

```
SET ASNAMES=ON
DEFINE FILE MOVIES
NEWTITLE/A1024=TITLE;
END
TABLE FILE MOVIES
PRINT NEWTITLE AS TITLE1
   NEWTITLE AS TITLE2
   NEWTITLE AS TITLE3
   NEWTITLE AS TITLE4
   NEWTITLE AS TITLE5
ON TABLE HOLD AS GIANTMOV FORMAT FOCUS
END
```

The Master File generated by this request has one unique child segment:

```
FILENAME=GIANTMOV, SUFFIX=FOC     , $
   SEGMENT=SEG01, SEGTYPE=S1, $
   FIELDNAME=FOCLIST, ALIAS=E01, USAGE=I5, $
      FIELDNAME=TITLE1, ALIAS=E02, USAGE=A1024, TITLE='TITLE1', $
      FIELDNAME=TITLE2, ALIAS=E03, USAGE=A1024, TITLE='TITLE2', $
      FIELDNAME=TITLE3, ALIAS=E04, USAGE=A1024, TITLE='TITLE3', $
      SEGMENT=SEG02, SEGTYPE=U, PARENT=SEG01, $
      FIELDNAME=TITLE4, ALIAS=E05, USAGE=A1024, TITLE='TITLE4', $
      FIELDNAME=TITLE5, ALIAS=E06, USAGE=A1024, TITLE='TITLE5', $
```

---

Increased Name Length for Dialogue Manager Variables

Dialogue Manager variable names on z/OS and z/VM can be up to 100 characters.

Increased Number of Amper Variables

An unlimited number of Dialogue Manager variables can be used in a procedure.

Raised Limit for Number of FML Rows

The limit on FML tag values is now based on available memory rather than on a hardcoded value to service larger FML requests. There is no new syntax and users interact with FML by entering FML requests using an editor as before.
Reference: Error Messages

If it is determined there is no more available memory, an internal routine displays one of the following messages before exiting the product:

**Reqfor: out of memory**

This indicates either too many labels or too much memory required.

**Rectok: out of memory**

Generated request cannot be parsed because not enough memory.

(This is not an FML-specific message.)

Increased Number of Joins

The number of joins that can be in effect at one time for one data source has been raised to 63. The joined structure can have a total of up to 64 segments. The total length of all fields can be up to 32K and the number of fields in a data source can be up to 3072.

For example, you can have 63 joins between 64 one-segment data sources or three joins between four 16-segment data sources, or any combination that does not exceed 64 segments.

If you are using a relational data adapter, the Relational Database Management System (RDBMS) may have its own limit for the number of joins allowed in an SQL statement. If you create a joined structure that exceeds the number of JOINs allowed by the RDBMS but is within the number of JOINs allowed by FOCUS, the join is processed by FOCUS, but not optimized (passed to the RDBMS for processing).
Increased Number of Files in a MATCH FILE Request

You could previously merge up to six different data sources or merge data from the same data source up to six times per request. That limit has been raised to 16, allowing you to merge up to 16 data sources in a single MATCH request.

The manner in which MATCH merges the data depends on the request context, or more specifically, the order in which the data sources, BY fields, and display commands are mentioned, as well as on the number of verb objects and BY phrases employed. As before, the following general MATCH conditions apply:

- You can use a total of 32 BY phrases and the maximum normal number of display fields in each MATCH request. You must specify at least one BY field for each file named in the MATCH request.
- DEFINE commands can be used.
- Up to 32 sort sets are supported, including the normal number of common sort fields.
- If used with MATCH, SET HOLDLIST behaves as if HOLDLIST were set to ALL.
- The ACROSS and WHERE TOTAL phrases are not permitted and you cannot use COMPUTE or BY HIGHEST in a MATCH request.

There is no new syntax for this feature.

Reference: Usage Notes for MATCH FILE Limit

The limit of 16 files represents the number of files supported in the most complex MATCH FILE requests. Simpler requests may be able to merge a higher number of files.

Increased Length for DESCRIPTION Attribute in a Master File

The length of the DESCRIPTION attribute for a field definition in a Master File has been raised to 2K.
Increase to the Total Length of All fields

The length of the LINREC and DATREC buffers has increased to 64K. Therefore, the total length of all fields read in a request can be up to 64K bytes. This includes fields in the Master File that are used in the request, fields created with the DEFINE and COMPUTE commands, and fields created internally as a result of internal computations or field reformatting. The total length of fields in the report output has not increased.

The number of fields allowed has not changed. All existing compiled MODIFY procedures should work without recompiling them.

Increased Length of DBA Passwords

DBA passwords can be up to 64 characters in length.

SET MAXLRECL = 65536

How to:
Enable Reading a File with a 65536 Byte Record Length

MAXLRECL indicates the largest actual file record length that FOCUS can read. The limit for MAXLRECL is 65536 bytes, allowing the user to read a record twice as large as the length of the internal matrix, which is limited to 32K. Therefore any request has this processing and output limitation.

Syntax: How to Enable Reading a File with a 65536 Byte Record Length

SET MAXLRECL = 65536
SET MAXLRECL = 65536
Starting in FOCUS 7.6.3, FOCLOG is a tool for recording and analyzing the use of FOCUS for your entire site. It comes packaged with a set of standard analytical reports that allow you to interrogate FOCUS usage—identify usage spikes and redundancies, detect large report requests, analyze time-of-day usage trends, and monitor ad hoc versus scheduled requests for each user. It even allows you to analyze the environmental conditions of the query such as use of joins, cross references, combines, MSO or SU. In addition, it collects and reports on statistics such as the number of data rows extracted and number of lines on the report output.

FOCLOG is invisible and non-intrusive to your production applications, whether batch or online. Rolled up and sorted in creative ways, the captured data provides the insight a site coordinator or manager needs to gain a clear picture of FOCUS usage and to target areas that could require adjustment, consolidation, or expansion.
Overview of FOCLOG

FOCLOG is a facility for logging FOCUS usage that was designed to have a negligible impact on FOCUS applications and to make it easy to analyze the collected data.

The cost of logging has been made so low as to be insignificant, so FOCUS usage can now be monitored continually, not just for selected periods. This is because the log is a simple sequential file to which usage data gathered during the FOCUS session or batch job is only appended when the FOCUS session ends.

Updates to the log from concurrently executing FOCUS sessions or batch jobs are serialized through a standard systems-wide z/OS Enqueue macro. The systems-wide scope allows a single log to gather usage data from users in different LPARS on the same machine.

The log is a physical sequential file with multiple record types that is easily read by FOCUS using a distributed Master File. Multiple logs can be logically concatenated so they are viewed as a single entity, and analyzed right where they are. Alternatively, since all the data is in character format, it can easily be moved to another platform—for example a laptop—where a more graphical analysis can be done using WebFOCUS.

How Logging is Implemented

The FOCLOG facility is incorporated into FOCUS. However, logging is only triggered if at the start of execution, FOCUS detects the presence of member FOCUSLOG in any of the data sets allocated to DDNAME ERRORS on z/OS or the FOCUSLOG ERRORS file on z/VM. This file in turn names the log data set itself. The ERRORS DDNAME is already allocated through JCL in all production FOCUS environments—FOCUS will not execute without it.

To inhibit logging, you can delete or rename the FOCUSLOG file or delete or rename the reference to the log file within the FOCUSLOG file.

When logging is triggered, usage data is collected and kept in memory as the application proceeds. The log itself is not opened until the FOCUS session or batch job ends. If FOCUS abends in the course of execution, or if it is stopped by the operator, the usage data will not be logged for those user sessions active at the time of the stoppage.
Extreme precautions have been taken to ensure that logging difficulties will not affect the application. If the log cannot be written for whatever reason (for example, it is full, the user has no write privilege to it, there has been an I/O error), the only effect on the application will be that the usage data will not be logged. This is true even if the logging difficulty results in an abend: FOCUS will recover and terminate normally.

Failures to log are not signaled through FOCUS-generated error messages.

On z/OS, if the logging failure caused an abend from which FOCUS recovered—for example a B37 abend caused by a log full condition—the occurrence of the abend will be recorded in the batch job step statistics or in your TSO log, but logging failures which do not cause an abend will not be recorded in any way.

On z/VM, your SFS (Shared File System) Administrator can see the log full condition recorded in the Filepool Console log.

The z/OS ISPF or z/VM FILELIST utility can be used to examine the date and time of the last update of the log.

The Log Data Set

On z/OS, the first 44 bytes of the first record of the FOCUSLOG member in the concatenation of data sets allocated to DDNAME ERRORS contains the fully qualified data set name of the current log file.

On z/VM, the first record of the FOCUSLOG ERRORS file contains the fully qualified name of the SFS directory.

Other records in the FOCUSLOG file are ignored, so they can safely be used to retain the names of prior logs. The default is to create short logs; long logs are created by following the log file name with the keyword DETAIL. This keyword gives you everything recorded in the short log and adds the data set or file names for the FOCEXEC, Master File, and Access File used in each request.

The site administrator must ensure that the LOG file is write-accessible to all FOCUS users and protected against archiving—FOCUS will not wait until an archived log is restored, rather it will skip logging instead. Therefore, the log file should not be managed by DFSMS.
The log consists of four types of records:

<table>
<thead>
<tr>
<th>Type of record</th>
<th>Size in bytes</th>
<th>Number of Occurrences</th>
</tr>
</thead>
<tbody>
<tr>
<td>Session</td>
<td>168</td>
<td>One per FOCUS session or batch job</td>
</tr>
<tr>
<td>Command</td>
<td>129 or 173</td>
<td>One per FOCUS command that accesses data</td>
</tr>
<tr>
<td>File</td>
<td>28 or 116</td>
<td>One per MASTER file referenced by the command</td>
</tr>
<tr>
<td>Dataset</td>
<td>68</td>
<td>One per data set still allocated at the end of the job</td>
</tr>
</tbody>
</table>

The detailed description of each record is in the distributed FOCLOG Master File and in *Information Captured in the FOCLOG File* on page 369. Long and short logs have identical Master Files; in the short log the Master File, Access File, and FOCEXEC data set names will appear blank.

**Sample FOCLOG Configuration Scenarios**

In the following diagram of a single LPAR configuration, one FOCLOG file records the usage of all FOCUS users in that LPAR:

**Single LPAR Configuration**
In a site configuration where FOCUS resides in several LPARS, even with different OS levels, a single FOCLOG file can reside in any one of the LPARs.

**Multiple LPAR Configuration**

*in a Sysplex Environment*

---

**Implementing FOCLOG**

**In this section:**
- Overview of FOCLOG Implementation
- Allocating the FOCLOG Log File
- Activating FOCLOG
- Validating the FOCLOG Configuration on z/OS
- Validating the FOCLOG Configuration on z/VM
- Running the FOCLOG Reports

The person implementing FOCLOG should be a system administrator with the ability to create and allocate data sets and who can assign RACF rules. Knowledge of FOCUS is not required.

The modules, FOCEXECs, and Master File needed to run FOCLOG and the FOCLOG reports are distributed as part of the standard FOCUS libraries. No installation steps are required. The administrator only needs to create a log file and activate it by specifying the fully qualified name of the SFS directory in the FOCUSLOG file.
If your site standards require you to implement new features in a test environment, create a temporary FOCUSLOG ERRORS file.

- On z/OS, create a copy of your FOCUS production CLIST and concatenate your ERRORS library in front of the FOCUS production ERRORS library.
- On z/VM, place your FOCUSLOG ERRORS file on a private minidisk that is higher in the search order than the FOCUS production minidisk.

Create a temporary log file and place its fully qualified SFS directory name in your private version of the FOCUSLOG ERRORS file.

After validating the FOCLOG implementation, remove your private FOCUSLOG file from your CLIST or minidisk.

**Overview of FOCLOG Implementation**

**Reference:**

Usage Notes for FOCLOG

These steps provide a high level overview of the FOCLOG implementation process:

1. Allocate the FOCLOG data set.
2. Activate FOCLOG.
3. Validate the FOCLOG configuration.
4. Move FOCLOG to your production FOCUS environment.
5. Run the reports supplied with FOCLOG after collecting log data for whatever period you deem appropriate.
Reference: Usage Notes for FOCLOG

- To avoid archiving the FOCLOG data set, it should not be managed by DFSMS.

- To keep the FOCLOG file a manageable size, the log was designed to capture only those commands that allow you to analyze the function of FOCUS applications at your site. Therefore, by design, only the following commands are captured in the log file: RUN (to run a compiled MODIFY), MAINTAIN, CREATE, FSCAN (as FOC$SCAN), GRAPH, HOLD, MATCH FILE, MODIFY, RETYPE, SCAN, TABLE, and TABLEF. Other commands issued during one of these requests (for example, JOIN or CHECK FILE) are not captured in the log file. However, if a JOIN or cross reference is in effect, all of the joined files are listed in the log after a TABLE request that references the join. MATCH FILE captures only the first file.

- The following commands are not captured in the log file: REBUILD, JOIN, CHECK FILE, MORE.

- In the event that the log file becomes full, recording stops for all users. To replace the log file, you can rename the full log file and allocate another empty file with the name of the original log file. Logging will resume the next time a user session ends (at FIN).

Allocating the FOCLOG Log File

**How to:**

Allocate the FOCLOG Log File on z/OS

Estimate the Size of the Log File

You must have a log file allocated and reference it in the FOCUSLOG ERRORS file in order to initiate logging. You should first determine the size of the log file required as described in *How to Estimate the Size of the Log File* on page 357.
**Implementing FOCLOG**

**Procedure: How to Allocate the FOCLOG Log File on z/OS**

1. Allocate a physical sequential file with LRECL 256 and RECFM VB using the size estimate you determined in Step 1.

   Edit and submit the following job to allocate the FOCLOG log file after adding an appropriate job card:

   ```
   /** add job card here */
   FLALLOC EXEC PGM=IEFBR14
   FOCLOGF DD DSN=flhlq.FOCLOG.DATA,DISP=(NEW,CATLG),
   VOL=SER=volser,UNIT=unit,SPACE=(CYL,(p,s)),
   DCB=(RECFM=VB,LRECL=256,BLKSIZE=12288),DSORG=PS
   */
   ```

   where:

   - **flhlq**
     Is the high level qualifier for the FOCLOG file.

   - **unit**
     Is a valid DASD unit for the FOCLOG file.

   - **volser**
     Is the volume serial number of the unit on which you want to store the FOCLOG file.

   - **p**
     Is the primary space allocation in cylinders.

   - **s**
     Is the secondary space allocation in cylinders.

2. Using your security interface (for example, RACF), authorize all of your FOCUS users in the entire sysplex to have write access across the sysplex to this file.

The following are suggestions for naming conventions for your log file:

- Create a separate log for each day of the week, for example FOCLOGMO, FOCLOGTU, FOCLOGWE, FOCLOGTH, FOCLOGFR, FOCLOGSA, and FOCLOGSU.

- Use a numbering convention such as FOCLOG1, FOCLOG2, FOCLOG3, and so on, to name multiple log files.

- Name log files by system and date, such as S1091507. Where S1 represents System number 1 and 091507 represents the day of the year (in this example, September 15, 2007).

- Allocate the log file as a Generation Data Group (GDG) in which case the system creates a naming convention by using index numbers for each generation.
**Procedure: How to Estimate the Size of the Log File**

The size of the log file required depends on factors such as the number of users and FOCUS applications in your environment, plus the length of time for which you wish to capture information.

Consider these suggestions when estimating its size:

**Estimating user session statistics.** A sample user session lasting one hour and containing 26 DD allocations running 25 TABLE requests will produce approximately 77 output records to the log. There will be one session record for the user session, 26 DSNS records (one per DD allocation), and 50 records from the TABLE requests (2 per request). Assuming that the average number of bytes per record is 50, this sample user session will produce 3850 bytes of output in the log.

One cylinder on an IBM 3390-3 device contains 737280 bytes. Therefore, approximately 190 user sessions of this size would fill one cylinder (737280 / 3850).

To apply this calculation at your site, you must evaluate the number of allocations in your production FOCUS CLIST/JCL and estimate how many TABLE requests each session is likely to run in an hour. Then use the following formulas to estimate the size of the log file:

\[
\text{bytes_per_hr} = \text{no_of_users} \times ((1+ \text{number_of_allocs} + (2 \times \text{avg_no_of_TABLEs})) \times 50)
\]

\[
\text{user_sessions_per_cylinder} = \frac{737280}{\text{bytes_per_hr}}
\]

Determine how many user sessions you wish to log per day, week, or month and allocate cylinders accordingly. For example, using the sample session described above, eight cylinders would be adequate for collecting 190 user sessions per hour for an eight hour period.

**Collecting sample data.** If you don’t know the level of FOCUS usage at your site, and cannot apply the above technique, you may just wish to collect data for a given period using a large log file and see how long it takes to fill or how much is used. For example, allocate a 100-cylinder log file for use in production for one business day and at day’s end, use ISPF to determine how much of the log was populated. If you used 10 cylinders of the log file on a fairly typical day, a good estimate for the size is 10 cylinders per day. Extend this to determine numbers of cylinders required for longer periods. The only penalty for under-sizing your log is that logging stops when the log is full.

In designing the log file, also take the following considerations into account:

- You can easily FTP or email small logs to other locations (for example, your Desktop) for analysis with tools such as WebFOCUS or Excel.
- Large log files can capture data for longer periods without continuous monitoring, but require more time for usage review and are slower when generating reports.
Activating FOCLOG

Example:
- Requesting a Default Form of the Log on z/OS
- Requesting a Default Form of the Log on z/VM
- Requesting a Detailed Form of the Log on z/OS
- Requesting a Detailed Form of the Log on z/VM
- Requesting a Session Summary Form of the Log on z/OS
- Requesting a Session Summary Form of the Log on z/VM

Reference:
- Notes on Activation and Deactivation of Logging

Usage can be logged at three levels, producing either a short form log, a detailed log, or a summary log, as described in the examples that follow.

Activation of logging requires three components:

1. On z/OS, the presence of a FOCUSLOG member in the concatenation of data sets allocated to DDNAME ERRORS. On z/VM, the existence of a FOCUSLOG ERRORS file on a disk accessed by FOCUS users.

2. The FOCUSLOG file must contain the name of the FOCLOG log file.

3. An indicator for the type of log desired.

Example: Requesting a Default Form of the Log on z/OS

The FOCUSLOG file in this example points to a FOCLOG file named FLHLQ.FOCLOG.DATA. Because the data set name is followed by blanks, this generates a default form of the log containing information about all attributes defined in the FOCLOG Master File, except the data set names of the FOCEXEC files, Access Files, and Master Files.

FLHLQ.FOCLOG.DATA

Example: Requesting a Default Form of the Log on z/VM

The FOCUSLOG file in this example points to an SFS directory named VMSYSU:FOCLOG.DATA. Because the directory name is followed by blanks, this generates a default form of the log containing information about all attributes defined in the FOCLOG Master File, except the data set names of the FOCEXEC files, Access Files, and Master Files.

VMSYSU:FOCLOG.DATA
Example: Requesting a Detailed Form of the Log on z/OS

This FOCUSLOG member produces a detailed form of the log containing everything in the FOCLOG Master File plus the data set names of FOCEXEC files, Master Files, and Access Files.

To create the detailed log, the FOCLOG file named FLHLQ.FOCLOG.DATA must be followed by at least one blank and the word DETAIL:

```
FLHLQ.FOCLOG.DATA DETAIL
```

Example: Requesting a Detailed Form of the Log on z/VM

The FOCUSLOG file in this example points to an SFS directory named VMSYSU:FOCLOG.DATA. Because the directory name is followed by the keyword DETAIL, this generates a detailed form of the log containing everything in the FOCLOG Master File plus the data set names of FOCEXEC files, Master Files, and Access Files:

```
VMSYSU:FOCLOG.DATA DETAIL
```

Example: Requesting a Session Summary Form of the Log on z/OS

This FOCUSLOG member points to the same log file as the one defined in Requesting a Default Form of the Log on z/OS on page 358, but this request creates a session summary form of the log containing only information contained in the session segment of the FOCLOG Master File.

To create a session summary log, the FOCLOG file named FLHLQ.FOCLOG.DATA must be followed by at least one blank plus the word SESSION:

```
FLHLQ.FOCLOG.DATA SUMMARY
```

Example: Requesting a Session Summary Form of the Log on z/VM

The FOCUSLOG file in this example points to an SFS directory named VMSYSU:FOCLOG.DATA. Because the directory name is followed by the keyword SUMMARY, this generates a session summary form of the log containing only information contained in the session segment of the FOCLOG Master File.

```
VMSYSU:FOCLOG.DATA SUMMARY
```

Reference: Notes on Activation and Deactivation of Logging

When FOCUS is initiated, it checks for the presence of the log file. If the FOCUSLOG file is present and contains the name of a log file, usage data is written to memory during the FOCUS session. The information stored in memory is written to the log file at FIN, during FOCUS termination. Therefore, FOCLOG does not produce any unnecessary overhead or use additional CPU cycles for capturing usage data.
Because logging depends on having a FOCUSLOG file that points to a log file, you can deactivate FOCLOG by taking any of the following actions. These actions are listed in the recommended order:

- Rename the log file itself so that the FOCUSLOG file no longer points to a valid log file.

  You can also use this technique to save an old log and start a new log file. For example, if the old log file is named FLHLQ.FOCLOG.DATA, rename it to FLHLQ.FOCLOG.DATA1, and allocate a new file as FLHLQ.FOCLOG.DATA. **Note:** Log replacement should be done as quickly as possible to avoid losing data that should be captured in the log.

- Rename the pointer to the log file in your FOCUSLOG member. For example, assume the FOCUSLOG file contains the following log file name:

  On **z/OS:**
  
  FLHLQ.FOCLOG.DATA

  On **z/VM:**
  
  VMSYSU:FOCLOG.DATA

  Change this entry in FOCUSLOG so that it no longer points to a valid log file or SFS directory. For example, if no file exists with the name FOCLOG.DATAOFF, change the pointer in FOCUSLOG to reference this non-existent file:

  On **z/OS:**
  
  FLHLQ.FOCLOG.DATAOFF

  On **z/VM:**
  
  VMSYSU:FOCLOG.DATAOFF

- Rename the FOCUSLOG file so that it is not found under the name FOCUSLOG. For example, change the name to FOCLGOFF.
Validating the FOCLOG Configuration on z/OS

**Example:**

Sample FOCUS Session on z/OS

This step validates your FOCLOG configuration and enables you to confirm that the log file was allocated and defined properly. It does not test FOCUS functionality, which is not impacted by FOCLOG.

1. To create the validation environment, make a test copy of your FOCUS production CLIST or batch job. This CLIST should allocate the production versions of the ERRORS, MASTER, and FOCEXEC DDNAMEs.

2. Run the test CLIST or batch job to enter FOCUS.

3. Next, execute a request to populate the log:

   At the FOCUS prompt, issue the following command and press Enter to create a temporary FOCUS database named CAR and load it with data:

   ```
   EX FLVALPOP
   ```

   The following messages display:

   ```
   > NEW FILE CAR     ON 09/15/2007 AT 09.06.57
   CAR     ON 09/15/2007 AT 09.06.57
   WARNING..TRANSACTIONS ARE NOT IN SAME SORT ORDER AS FOCUS FILE
   PROCESSING EFFICIENCY MAY BE DEGRADED
   TRANSACTIONS:     TOTAL =    53  ACCEPTED=    53  REJECTED=     0
   SEGMENTS:          INPUT =   102  UPDATED =     0  DELETED =     0
   ```

   You can ignore any warning messages. The important thing to note is that 53 transactions were accepted and that 102 segments were input. **Note:** If you have problems running this procedure, please contact the Information Builders Customer Support Services staff.

4. Exit from FOCUS by issuing the following command and pressing Enter:

   ```
   FIN
   ```

   Ending the FOCUS session updates the log with the information about the procedure you executed.

5. Run the test CLIST or batch job to enter FOCUS again.
Implementing FOCLOG

6. You will now execute a request to produce a validation report from the log.

   a. Issue the following command to allocate your log file so that you can issue a report request against it. Replace \textit{flhlq} with the high level qualifier for your log file data set. (\textbf{Note:} Before pressing Enter, make sure the data set name is the name of the log file you specified in the FOCUSLOG member of your production ERRORS.DATA library.):

   \texttt{DYNAM ALLOC DD FOCLOG DA flhlq.FOCLOG.DATA SHR REU}

   b. Issue the following command and then press Enter to report from the log:

   \texttt{EX FLVALRPT}

   The following messages display to indicate that the report is ready to view:

   \texttt{> NUMBER OF RECORDS IN TABLE= 3 LINES= 3}

   PAUSE.. PLEASE ISSUE CARRIAGE RETURN WHEN READY

   Press Enter to view the report. It should be similar to the following, but display your session statistics and user ID:

   PAGE 1

   VALIDATION OF SESSION COMMANDS ISSUED

   \begin{tabular}{llllllll}
   \hline
   \textbf{STARTDATE} & \textbf{SESSTART} & \textbf{USERID} & \textbf{COMMAND} & \textbf{FNAME} & \textbf{RECORDS} & \textbf{LINES} \\
   \hline
   2007/09/15 11:45:05.260 & FLHLQ & \textit{CREATE} & . & 0 & 0 & \\
   FLHLQ & \textit{MODIFY} & \textit{CAR} & 102 & 0 & \\
   FLHLQ & \textit{TABLE} & \textit{CAR} & 18 & 1 & \\
   \hline
   \end{tabular}

   This output shows that the log is working properly. After producing the report, the procedure deallocates DDNAMEs CAR and FOCLOG. \textbf{Note:} If you have problems running this request, please contact the Information Builders Customer Support Services staff.

   Press Enter to close the report window.

7. Exit from FOCUS by issuing the following command and then pressing Enter:

   \texttt{FIN}

You have now completed the configuration and validation process. You can now notify your FOCUS Administrator that the product is available for use.

\textbf{Note:} This validation procedure added data to the log file that does not reflect actual FOCUS usage at your site. Therefore, you should edit the log file to delete this data before putting the log into production. To delete the data, open the log file in the ISPF Edit Panel and delete the lines that contain the data.
Example: **Sample FOCUS Session on z/OS**

When you enter an online FOCUS session, you see a banner similar to the following. The two carets at the bottom (>) are the FOCUS prompt, although your site may have changed the prompt:

```
FOCUS  7.6.3   09/15/2007  10.12.52
```

OBSERVED CPU:

* CEC: machine type N/A  model ID N/A  capacity N/A
* LPAR: name N/A  capacity N/A
* VM: name N/A  capacity N/A
* Processor AF4A Model 2066-00 Max 02  Site

LICENSED CPU(S):

* Processor 5394 Model 9672-F0 Max 01 >Registration 57E3C86A0887

The following command executes the request that populates the log:

```
>  > ex flvalpop
```

The following messages display:

```
>   NEW FILE CAR      ON 09/15/2007 AT 09.06.57
CAR      ON 09/15/2007 AT 09.06.57
WARNING..TRANSACTIONS ARE NOT IN SAME SORT ORDER AS FOCUS FILE
PROCESSING EFFICIENCY MAY BE DEGRADED
TRANSACTIONS:         TOTAL =    53  ACCEPTED=    53  REJECTED=     0
SEGMENTS:             INPUT =   102  UPDATED =     0  DELETED =     0
```

The next command ends the FOCUS session and updates the log with statistics regarding the FLVALPOP request:

```
> fin
```

Next, we run the CLIST again to go back into FOCUS:

```
FOCUS  7.6.3   09/15/2007  10.12.52
```

OBSERVED CPU:

* CEC: machine type N/A  model ID N/A  capacity N/A
* LPAR: name N/A  capacity N/A
* VM: name N/A  capacity N/A
* Processor AF4A Model 2066-00 Max 02  Site

LICENSED CPU(S):

* Processor 5394 Model 9672-F0 Max 01 >Registration 57E3C86A0887

Now we allocate the log file and issue the FLVALRPT request to view information from the log:

```
>  > dynam alloc dd foclog da flhlq.foclog.data shr reu
>  > ex flvalrpt
```
The following messages display to indicate that the report is ready to view:

```
>   NUMBER OF RECORDS IN TABLE= 3  LINES= 3

PAUSE.. PLEASE ISSUE CARRIAGE RETURN WHEN READY
```

Pressing Enter displays the report:

```
PAGE 1
```

**VALIDATION OF SESSION COMMANDS ISSUED**

<table>
<thead>
<tr>
<th>STARTDATE</th>
<th>SESSTART</th>
<th>USERID</th>
<th>COMMAND</th>
<th>FNAME</th>
<th>RECORDS</th>
<th>LINES</th>
</tr>
</thead>
<tbody>
<tr>
<td>2007/09/15 11:45:05.260</td>
<td>FLHLQ</td>
<td>CREATE</td>
<td>.</td>
<td>0</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>FLHLQ</td>
<td>MODIFY</td>
<td>CAR</td>
<td>102</td>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>FLHLQ</td>
<td>TABLE</td>
<td>CAR</td>
<td>18</td>
<td>1</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Next, press Enter to close the report window and return to the FOCUS prompt.

Execute the `FIN` command to end the FOCUS session:

```
> fin
```

Now empty the log file (using ISPF Edit) before putting the log into production.

## Validating the FOCLOG Configuration on z/VM

**Example:**

Sample FOCUS Session on z/VM

This step validates your FOCLOG configuration and enables you to confirm that the log file was accessed and defined properly. It does not test FOCUS functionality, which is not impacted by FOCLOG.

1. To create the validation environment, make a test copy of the EXEC that your customers use to access FOCUS. This EXEC should FILEDEF the production versions of the ERRORS, MASTER, and FOCEXEC files.

2. Run the test EXEC to enter FOCUS.
3. Next, execute a request to populate the log:

Edit the FLVALPOP FOCEXEC and delete the following lines near the top of the file, then save the edited file:

00006 -? TSO DDNAME CAR
00007 -IF &DSNAME EQ ' ' THEN GOTO ALLOC1
00008 DYNAM FREE DD CAR
00009 -ALLOC1
00010 DYNAM ALLOC DD CAR RECFM F LRECL 4096 BLKSIZE 4096 -
00011 DSORG PS -
00012 SPACE 1,3 CYL
00013 -RUN

At the FOCUS prompt, issue the following command and press Enter to create a temporary FOCUS database named CAR and load it with data:

EX FLVALPOP

The following messages display:

> NEW FILE CAR   FOCUS   A1      ON 09/15/2007 AT 09.06.57
CAR       FOCUS   A1      ON 09/15/2007 AT 09.06.57
WARNING..TRANSACTIONS ARE NOT IN SAME SORT ORDER AS FOCUS FILE
PROCESSING EFFICIENCY MAY BE DEGRADED
TRANSACTIONS:     TOTAL =    53  ACCEPTED=    53  REJECTED=     0
SEGMENTS:         INPUT =   102  UPDATED =     0  DELETED =     0

You can ignore any warning messages. The important thing to note is that 53 transactions were accepted and that 102 segments were input. Note: If you have problems running this procedure, please contact the Information Builders Customer Support Services staff.

4. Exit from FOCUS by issuing the following command and pressing Enter:

FIN

Ending the FOCUS session updates the log with the information about the procedure you executed.

5. Run the test EXEC to enter FOCUS again.
6. You will now execute a request to produce a validation report from the log.

   a. Issue the following commands to ACCESS and FILEDEF your log file so that you can issue a report request against it. (Note: Before pressing Enter, make sure the data set name is the name of the log file you specified in the FOCUSLOG file.). For example:

   ```
   ACCESS VMSYSU:USER1.FOCLOG B
   CMS FILEDEF FOCLOG DISK FOCLOG DATA B
   ```

   b. Issue the following command and then press Enter to report from the log:

   ```
   EX FLVALRPT
   ```

   The following messages display to indicate that the report is ready to view:

   ```
   >   NUMBER OF RECORDS IN TABLE=        3  LINES=      3
   >   PAUSE.. PLEASE ISSUE CARRIAGE RETURN WHEN READY
   ```

   Press Enter to view the report. It should be similar to the following, but display your session statistics and user ID:

   PAGE     1

   VALIDATION OF SESSION COMMANDS ISSUED

<table>
<thead>
<tr>
<th>STARTDATE</th>
<th>SESSTART</th>
<th>USERID</th>
<th>COMMAND</th>
<th>FNAME</th>
<th>RECORDS</th>
<th>LINES</th>
</tr>
</thead>
<tbody>
<tr>
<td>2007/09/15</td>
<td>11:45:05.260</td>
<td>FLHLQ</td>
<td>CREATE</td>
<td>.</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>FLHLQ</td>
<td>MODIFY</td>
<td>CAR</td>
<td>102</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>FLHLQ</td>
<td>TABLE</td>
<td>CAR</td>
<td>18</td>
<td>1</td>
</tr>
</tbody>
</table>

   This output shows that the log is working properly. Note: If you have problems running this request, please contact the Information Builders Customer Support Services staff.

   Press Enter to close the report window.

7. Exit from FOCUS by issuing the following command and then pressing Enter:

   ```
   FIN
   ```

   You have now completed the configuration and validation process. You can now notify your FOCUS Administrator that the product is available for use.

   Note: This validation procedure added data to the log file that does not reflect actual FOCUS usage at your site. Therefore, you should edit the log file to delete this data before putting the log into production. To delete the data, open the log file in XEDIT and delete the lines that contain the data.
Example: Sample FOCUS Session on z/VM

When you enter an online FOCUS session, you see a banner similar to the following. The two carets at the bottom (> >) are the FOCUS prompt, although your site may have changed the prompt:

FOCUS  7.6.3   11/02/2007  09.50.12  GEN231
OBSERVED CPU:
****** Processor 00AF5A Model 2066-000 Max 001 >Site GEN2
LICENSED CPU(S):
****** Processor 005394 Model 9672-0F0 Max 001 >Registration 57E3C86A0887

The following command executes the request that populates the log:

>  > ex flvalpop

The following messages display:

NEW FILE CAR     FOCUS   A1 ON 11/02/2007 AT 09.55.09
CARFL   FOCUS   A1 ON 11/02/2007 AT 09.55.11
WARNING..TRANSACTIONS ARE NOT IN SAME SORT ORDER AS FOCUS FILE
PROCESSING EFFICIENCY MAY BE DEGRADED
TRANSACTIONS: TOTAL = 53 ACCEPTED= 53 REJECTED= 0
SEGMENTS: INPUT = 102 UPDATED = 0 DELETED = 0

The next command ends the FOCUS session and updates the log with statistics regarding the FLVALPOP request:

> fin

Next, we ACCESS and FILEDEF the log file:

ACCESS VMSYSU:USER1.FOCLOG B
CMS FILEDEF FOCLOG DISK FOCLOG DATA B

Then, we go back into FOCUS:

FOCUS  7.6.3   11/02/2007  09.55.10  GEN231
OBSERVED CPU:
****** Processor 00AF5A Model 2066-000 Max 001 >Site GEN2
LICENSED CPU(S):
****** Processor 005394 Model 9672-0F0 Max 001 >Registration 57E3C86A0887

Now we issue the FLVALRPT request to view information from the log:

>  > ex flvalrpt

The following messages display to indicate that the report is ready to view

>   NUMBER OF RECORDS IN TABLE=        3  LINES=      3

PAUSE.. PLEASE ISSUE CARRIAGE RETURN WHEN READY
Implementing FOCLOG

Pressing Enter displays the report:

```
PAGE   1

VALIDATION OF SESSION COMMANDS ISSUED

<table>
<thead>
<tr>
<th>STARTDATE</th>
<th>SESSTART</th>
<th>USERID</th>
<th>COMMAND</th>
<th>FNAME</th>
<th>RECORDS</th>
<th>LINES</th>
</tr>
</thead>
<tbody>
<tr>
<td>2007/09/15</td>
<td>11:45:05.260</td>
<td>FLHLQ</td>
<td>CREATE</td>
<td>.</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>FLHLQ</td>
<td>MODIFY</td>
<td>CAR</td>
<td>102</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>FLHLQ</td>
<td>TABLE</td>
<td>CAR</td>
<td>18</td>
<td>1</td>
</tr>
</tbody>
</table>
```

Next, press Enter to close the report window and return to the FOCUS prompt.

Execute the FIN command to end the FOCUS session:

```
> fin
```

Now empty the log file (using XEDIT) before putting the log into production.

**Running the FOCLOG Reports**

FOCLOG is now configured. See *FOCLOG Reporting* on page 375, for instructions about reporting on the captured data.
Information Captured in the FOCLOG File

The FOCLOG file is a fixed format physical sequential file. FOCLOG is distributed with a Master File that describes the FOCLOG file and enables you to report from it.

The Master File has four segments:

- The session segment provides information specific to a user’s session.
- The command segment provides information about FOCUS commands issued during a user’s session.
- The master segment provides Master File names, file types, and the ID of the sink machine on which each Master File resides.
- The data set name segment provides names and locations of data sets used during a user’s session.

Reference: Session Segment Information

FOCLOG Reporting

In this section:
Using the Menu-Driven FOCLOG Reporting Interface
Report Layouts
Report Contents
Sort Options
Report Descriptions

FOCLOG comes packaged with a Master File that gives FOCUS access to the log file. It also comes with a menu driven interface with usage reports that you can start running as soon as you decide you have collected enough usage data.

Using the Menu-Driven FOCLOG Reporting Interface

How to:
Invoke the FOCLOG Reporting Interface
Build and Catalog a Custom FOCLOG Report

Reference:
Specifying Values Used in Report Generation

Example:
Running a FOCLOG Report

The menu-driven FOCLOG reporting interface provides a review of usage patterns and detailed analysis of the FOCLOG file. Overlap between the summary and detailed report contents support easy analysis of the usage data. Run-time options enable easy adjustment of the collection and aggregation periods and sort criteria to aid in analyzing apparent anomalies.

The reports are organized into dimensions that group similar types of reports and concepts of analysis.
Reference: Specifying Values Used in Report Generation

Before running the reporting interface, you must edit the FLPROF FOCEXEC file to specify the company name you want to display in the report headings and to allocate or FILEDEF your FOCLOG log file.

The following is a listing of the FLPROF FOCEXEC:

```
-************************************************************************
- *
- * INFORMATION BUILDERS INC.
- * FOCLOG STATISTICAL REPORTS
- *
- * PROFILE FOR FOCLOG REPORTING
- *
-************************************************************************
```

```
- ** * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * *
- * PUT YOUR COMPANY NAME HERE AS IT SHOULD APPEAR ON ALL REPORTS.
- SET &&COMPANY = 'INFORMATION BUILDERS INC.'; 
- *
- IF &FOCMODE EQ 'TSO' OR 'MVS' GOTO MVS_ALLOC ;
- *       VM/CMS USERS
- * CHANGE THE FOLLOWING LINE TO REFLECT THE SFS DIRECTORY NAME
- *       YOU CHOSE FOR YOUR FOCLOG FILE.
CMS FILEDEF FOCLOG DISK VMSYSU:FOCLOG.DATA
- GOTO CONT
- MVS_ALLOC 
- *       MVS/TSO USERS
- * CHANGE THE FOLLOWING LINE TO REFLECT THE DATASET NAME
- *       YOU CHOSE FOR YOUR FOCLOG FILE.
DYNAM ALLOC FILE FOCLOG DA FLHLQ.FOCLOG.DATA SHR REUSE
- RUN
- CONT
- ** * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * *
```

Make the following changes:

- Replace ‘INFORMATION BUILDERS, INC.’ with your company name in the following line:
  
  ```
  -SET &&COMPANY = 'INFORMATION BUILDERS INC.';
  ```

- If you are running on z/VM, replace VMSYSU:FOCLOG.DATA with your SFS directory name in the following line:
  
  ```
  CMS FILEDEF FOCLOG DISK VMSYSU:FOCLOG.DATA
  ```
If you are running on z/OS, replace FLHLQ.FOCLOG.DATA with the fully qualified name of your FOCLOG log file in the following line:

```
DYNAM ALLOC FILE FOCLOG DA FLHLQ.FOCLOG.DATA SHR REUSE
```

Save the edited version of FLPROF FOCEXEC before running the reports.

**Procedure: How to Invoke the FOCLOG Reporting Interface**

From FOCUS, issue the following command to display report selection menu:

```
EX FLMENU
```

```
MAINFRAME FOCUS UTILIZATION ANALYSIS

DIMENSION: USER FILE PROCEDURE USAGE CUSTOM ADHOC

****

101 - DURATION OF ONLINE SESSIONS
102 - HIGHEST CPU-CONSUMING USERS AND JOBS
103 - MOST ONLINE SESSIONS
104 - TOTAL MSO SESSIONS
105 - TOTAL FOCUS USERS
106 - ATTEMPT TO GROUP USERS BY 4-CHAR PREFIX
107 - SITE-WIDE FOCUS USAGE TREND
108 - BATCH JOB DETAILS
109 - ONLINE SESSION DETAILS

SELECT: 
```

Use the PF8 and PF7 keys to move forward and backward through the report selection menus for the following five reporting dimensions listed at the top of the screen:

- USER. These reports describe user-oriented activity on the system.
- FILE. These reports describe files accessed by FOCUS.
- PROCEDURE. These reports describe FOCUS programs running on the system.
- USAGE. These reports describe FOCUS activity.
- CUSTOM. These reports are provided by the user. For information on creating your own reports and adding them to the reporting interface, see *How to Build and Catalog a Custom FOCLOG Report* on page 381.

To select a specific report, enter its three-digit report number. If you know a report's three-digit number, you can enter that number from any screen.
**Tip:** If you are on a screen and want to run a report listed on that screen, you can enter the one or two-digit number to the right of the leftmost digit (which is the screen number). For example, if you are on screen 1, you can run report 109 by entering 9 or 09.

If you want to enter FOCUS from the interface in order to run your own requests against the FOCLOG file, select the ADHOC dimension.

Use the function keys as described at the bottom of each screen. Look for helpful messages that appear below the function key line.

Once you have selected a report, an options screen displays:

```
**** REPORT SELECTED: 101 ****

SELECT DATE RANGE OF REPORT (YYYY/MM/DD): 2007/08/01 TO 2007/08/27
AGGREGATE BY (Q)UARTER, (M)ONTH OR (W)EEK: X
SEND REPORT TO (S)CREEN, (P)RINTER OR (H)OLD? S
   IF (H)OLD, SELECT HOLD FORMAT:
   AS
CHOOSE OPTIONAL SORT FROM (NONE AVAILABLE) : X
RUN LIMITED DATA TO VIEW REPORT LAYOUT (Y/N): X
ENTER=RUN REPORT  F3=BACK TO REPORT SELECTION  F12=HELP
```

You can specify the following options on this screen:

- The date range covered. Supply the dates in YYYY/MM/DD format, using the default values as a guide. The default is a three-month range from the current date backwards.

- The aggregation period (Quarter, Month, Week). This applies to reports that have a calendar sort level and can accommodate the selection.

- The report destination (Screen, Print, Hold file). Enter:
  - S to see the report on your screen.
  - P to send the report to your printer.
  - H to store the report results in a HOLD file. By default, the format type will be a BINARY HOLD file. You can specify a different format and an AS phrase to supply a name other than the default name HOLD.
Sort options, if any are available for that report. The first sort is generally the time period. Some reports can be additionally sorted on other columns, such as duration, CPU, EXCP, records, and lines. Only the sorts applicable to that report are shown. If none are available, NONE AVAILABLE displays. Use the first letter of the word to select that sort column, or, if you do not want an additional sort level, either leave it blank or enter N (None).

The option of making a limited request to review report layout. Enter Y at this prompt to see a version of the report with limited data. A report may not display at all if no data matches the criteria for selecting the limited records.

The date period you select for the first request in a session remains in effect until you change it, which you can do on any report selection screen. This is also true for aggregation periods and report destinations.

Example: Running a FOCLOG Report

The following example runs FOCLOG report FLRPT204.

First, make sure you have access to the FOCLOG log file and that you added the appropriate DYNAM or FILEDEF command in the FLPROF FOCEXEC file.

Then, issue the following command to execute the reporting interface:

```
ex flmenu
```

The following screen displays:

```
MAINFRAME FOCUS UTILIZATION ANALYSIS

DIMENSION: USER  FILE  PROCEDURE  USAGE  CUSTOM  ADHOC

****

101 - DURATION OF ONLINE SESSIONS
102 - HIGHEST CPU-CONSUMING USERS AND JOBS
103 - MOST ONLINE SESSIONS
104 - TOTAL MSO SESSIONS
105 - TOTAL FOCUS USERS
106 - ATTEMPT TO GROUP USERS BY 4-CHAR PREFIX
107 - SITE-WIDE FOCUS USAGE TREND
108 - BATCH JOB DETAILS
109 - ONLINE SESSION DETAILS

SELECT:    

F3=EXIT    F7=PREVIOUS SCREEN    F9=MORE REPORTS    F12=HELP
```
FOCLOG Reporting

Press F8 to open the FILE screen:

MAINFRAME FOCUS UTILIZATION ANALYSIS

DIMENSION: USER FILE PROCEDURE USAGE CUSTOM ADHOC

****

201 - POSSIBLE EXTRACT FILES BEING USED
202 - FILES ORIGINATING LARGE HOLD FILE EXTRACTS
203 - FILES USED BY USERS
204 - BATCH AND ONLINE FILE USAGE
205 - REPORTS AND TRANSACTIONS AGAINST DATA SOURCES
206 - FILES USING THE MOST CPU ON REPORTS
207 - DATA SOURCE TYPES ACCESSED BY FOCUS
208 - MOST RECORDS EXTRACTED DURING ONLINE SESSIONS

SELECT: □□

F3-EXIT  F7-PREVIOUS SCREEN  F8-MORE REPORTS  F12-HELP

Enter the number 204 in the SELECT field to run FLRPT204. The Options screen opens:

MAINFRAME FOCUS UTILIZATION ANALYSIS

**** REPORT SELECTED: 204 ****

SELECT DATE RANGE OF REPORT (YYYY/MM/DD): 2007/07/01 TO 2007/10/26
AGGREGATE BY (Q)uarter, (M)onth OR (W)EEK: □
SEND REPORT TO (S)CREEN, (P)RINTER OR (H)OLD? □
   IF (H)OLD, SELECT HOLD FORMAT: □□□□□□□□ AS □□□□□□□□
CHOOSE OPTIONAL SORT FROM (D)URATION (C)PU (E)XCP : □

RUN LIMITED DATA TO VIEW REPORT LAYOUT (Y/N): □
ENTER=RUN REPORT  F3-BACK TO REPORT SELECTION  F12-HELP
Accept the default options and run the report by pressing Enter. A report similar to the following displays:

```
MAINFRAME FOCUS UTILIZATION ANALYSIS
INFORMATION BUILDERS INC.
JULY 1, 2007 - OCTOBER 26, 2007
BATCH AND ONLINE FILE USAGE

<table>

PAGE 1 2007/10/26 13:27.09 FLRPT204
```

Press Enter to scroll through subsequent pages of the report. At the last page of the report, press Enter to return to the menu screen.

**Procedure: How to Build and Catalog a Custom FOCLOG Report**

1. Write and debug a FOCEXEC that reports against the FOCLOG file. The author is responsible for code and results.

2. Store the FOCEXEC with a name of the following form:

   `FLRPT5.nn`

   where:

   `nn`

   Is the next available two-digit number on the CUSTOM screen. For example, the ninth custom report should be named `FLRPT509`. The screen supports up to 10 reports.
3. Have your FOCLOG Administrator edit the FLMENU FOCEXEC to:

   a. Adjust the CRTFORM of the CUSTOM screen with the name of your report at the proper number.

   b. Then, after the following line, change the associated 9xx to 5xx:

   ' -* REPORT NUMBER VALIDATION'

If you need any SET commands in your FOCEXEC, please reset them at the end of your routine. To do that, first capture the current setting with the following command:

   ? SET setname &HOLDIT

Then restore it at the end of the routine with:

   SET setname=&HOLDIT

**Report Layouts**

The packaged reports all have standard four-line headings:

```
MAINFRAME FOCUS UTILIZATION ANALYSIS
COMPANY NAME
DATES COVERED (FROM - TO)
FOCLOG REPORT NAME (generated by your selection)
```

Report footings contain the page number, the date and time the report was requested and the internal name of the report corresponding to its number on the selection screen.

**Report Contents**

Each report examines an aspect of FOCUS usage at your site. There is considerable overlap among reports, as some present high-level usage summaries while others provide underlying details, potentially generating tens or even hundreds of pages.

Use the detail level reports to examine suspicious or irregular value clues on the summary reports.

**Sort Options**

Columns are sorted consistently across reports. Date periods are sorted in ascending chronological order, names are sorted alphabetically, and numeric columns are typically sorted high to low where the numbers of most interest tend to be the higher ones.

When optional sorts are invoked, the notation “** SORT**” appears at the top of the sort column indicating its selection by the user as opposed to a default.
Report Descriptions

Reference:
User Reports - 100 Series
File Dimension Reports - 200 Series
Procedure Dimension Reports - 300 Series
Usage Dimension Reports - 400 Series

Each of the following tables describes the reports available for a specific dimension. Each report has an internal name of the form:

\[FLRPTnnn\]

where:

\[nnn\]

Is the three-digit report number on the menu screen.
The 100 Series reports show user activities and the resources consumed, permitting examination of usage by individuals, groups, usage types (online vs. batch) or a site-wide trend analysis.

<table>
<thead>
<tr>
<th>No.</th>
<th>Report Title and Contents</th>
<th>Interpreting Report Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>101</td>
<td><strong>Duration of Online Sessions</strong> summarizes the length of time users were logged on in predefined ranges of hours (&lt;1, 1-4, 4-8, 8-12, &gt;12). Only ranges with contents are displayed.</td>
<td>Look for the &gt;12 hours category, which often indicates IDs left on overnight, exorbitant usage, or a process running on an unattended ID. Many other reports show the breakdown of Duration to further investigate these situations. For example, sort report 109 by Duration to see who was logged on for the various periods.</td>
</tr>
<tr>
<td></td>
<td>- The &lt;1 hour group is usually ignored.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- 1-4 hours is effectively a morning or afternoon session, realizing that many users log off at lunch time, which creates two 1-4 hour sessions.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- 4-8 hours is a normal work day.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- 8-12 hours may show a dedicated worker.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- &gt;12 hours may be a terminal left on overnight.</td>
<td></td>
</tr>
<tr>
<td>102</td>
<td><strong>Highest CPU-Consuming Users and Jobs</strong> identifies users running procedures that absorbed the most CPU during the period. The report is sorted by CPU usage for Batch jobs and Online sessions</td>
<td>High CPU usage (particularly for online sessions) may indicate abuse or, more likely, users whose needs should be evaluated for possible efficiency improvement.</td>
</tr>
<tr>
<td>No.</td>
<td>Report Title and Contents</td>
<td>Interpreting Report Output</td>
</tr>
<tr>
<td>-----</td>
<td>------------------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>103</td>
<td><strong>Most Online Sessions</strong> summarizes usage trends over the period by number of sessions (grouped by tens) and most frequent users in each.</td>
<td>Spikes identify heavy usage periods, such as end-of-month, quarter, or year, or special promotions or events. Upward trends by period may indicate other symptoms. Run Report 108 or 109 to see details of a specific user’s activity in the higher categories.</td>
</tr>
<tr>
<td>104</td>
<td><strong>Total MSO Sessions</strong> shows, by period, what part of FOCUS online usage is performed via MSO (for sites running MSO).</td>
<td>A significant percentage generally indicates a company’s efficient use of shared resources provided by MSO.</td>
</tr>
<tr>
<td>105</td>
<td><strong>Total FOCUS Users</strong> rolls up overall FOCUS usage across the site for each period. The Active Users and Total Jobs columns imply average usage per user, and the CPU column tracks the actual FOCUS processing performed during the period.</td>
<td>Look for spikes (positive or negative) and progressive trends in the numbers. Many other reports break down these summarized numbers.</td>
</tr>
<tr>
<td>106</td>
<td><strong>Attempt to Group Users by 4-Char Prefix</strong> assumes that the first four characters of the userid roughly corresponds to definable groups in an organization. If that assumption is true for your company, this report may be of value. The report shows the number of users with that prefix and the CPU used by that group. Re-sorting by CPU could point to the largest group of FOCUS users on the site.</td>
<td>Assuming the first four user ID characters are significant workgroup differentiators, this report can be useful for comparing relative usage loads. Alternatively, see <em>Information Captured in the FOCLOG File</em> on page 369 for a description of the FOCLOG Master File in order to develop your own schemes for collapsing user IDs into local groups.</td>
</tr>
<tr>
<td>107</td>
<td><strong>Site-Wide FOCUS Usage Trend</strong> summarizes site-wide FOCUS usage for each period, broken out by batch and online usage and by Reports (extracts) versus Updates (data changes)</td>
<td>Look for significant usage spikes in CPU or number of runs, and possible imbalances between reports and update operations.</td>
</tr>
</tbody>
</table>
The 200 Series reports identify key files and show when and how they were used.

### Reference: File Dimension Reports - 200 Series

<table>
<thead>
<tr>
<th>No.</th>
<th>Report Title and Contents</th>
<th>Interpreting Report Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>108</td>
<td><strong>Batch Job Details</strong> describes every batch job during the period, showing the timestamp, who ran it, the LPAR FOCUS used, the job duration and CPU utilized.</td>
<td>This report could be hundreds or thousands of pages long. Sort by Duration or CPU to review largest jobs first.</td>
</tr>
<tr>
<td>109</td>
<td><strong>Online Session Details</strong> describes every online session run during the period, showing its start time, who logged on, the LPAR FOCUS used, job duration and CPU utilized.</td>
<td>This report could be hundreds or thousands of pages long. Sort by Duration or CPU to see the most CPU-intensive sessions first. Similar to FLRPT108 for batch usage</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>No.</th>
<th>Report Title and Contents</th>
<th>Interpreting Report Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>201</td>
<td><strong>Possible Extract Files Being Used</strong> identifies the largest flat files being used. Flat files are non-keyed sequential files rather than structured databases. They are typically created by other applications or by extracts from local databases. Extract files are often CPU savers in that they require fewer resources than repeatedly retrieving data from the main file. Not all files on this report are 'extract' files; the report only knows that they are SUFFIX=FIX files, so some knowledge of the origin and use of the files are critical to the evaluation.</td>
<td>Low use of extract files should be investigated for potential removal or merging. Even high usage could point to the need to evaluate a better way to supply that data. Extract files often unknowingly grow excessively large over time, so a point of re-evaluation may be warranted.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>No.</th>
<th>Report Title and Contents</th>
<th>Interpreting Report Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>202</td>
<td><strong>Files Originating Large HOLD File Extracts</strong> shows databases from which large extracts are generated. Frequent creation may point to the need to evaluate the creation strategy.</td>
<td>Confirm acceptability of large HOLD files.</td>
</tr>
<tr>
<td>No.</td>
<td>Report Title and Contents</td>
<td>Interpreting Report Output</td>
</tr>
<tr>
<td>-----</td>
<td>---------------------------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>203</td>
<td><strong>Files Used by Users</strong> shows the files accessed during the period by each user. Sort the report by Records, Lines, or CPU to see the most used files.</td>
<td>Use to investigate a user ID whose activity was highlighted on another report.</td>
</tr>
<tr>
<td>204</td>
<td><strong>Batch and Online File Usage</strong> shows relative FOCUS online and batch usage by file type. This report concentrates on the type of file rather than the filename itself.</td>
<td>Usage at both ends of the spectrum may be of interest, depending on site conditions. Re-sort by Duration, CPU, or EXCP to review impact by category.</td>
</tr>
<tr>
<td>205</td>
<td><strong>Reports and Transactions Against Data Sources</strong> details usage of specific data sources during each period. Sorted by period and file name.</td>
<td>Note the effect of file types on statistical columns. Scroll right to view Batch Updates column, which, along with the Batch Reports column, indicates the number of times the file was accessed during the period. Re-sort by Duration, CPU, or EXCP to review most used files by those categories.</td>
</tr>
<tr>
<td>206</td>
<td><strong>Files Using the Most CPU on Reports</strong> rolls up file usage across the entire period. Sorted by file name, you may resort by CPU, Records, or Lines to observe the most used files. Use FLRPT205 to break down the file usage by smaller periods.</td>
<td>The Rollup shows the degree to which the data extracted was aggregated on the report versus printed row by row as raw data. This implies output volume and how that file is being used. The higher the Rollup, the better.</td>
</tr>
<tr>
<td>207</td>
<td><strong>Data Source Types Accessed by FOCUS</strong> summarizes FOCUS use by file type.</td>
<td>Run Report FLRPT206 to assess usage by individual file.</td>
</tr>
<tr>
<td>208</td>
<td><strong>Most Records Extracted During Online Sessions</strong> summarizes users who extracted very large volumes of data on a regular basis, grouping record extracts in 100,000 record increments. It shows number of occurrences per group.</td>
<td>High numbers of occurrences might warrant a review of usage or indicate the need for a better way to access the data regularly</td>
</tr>
</tbody>
</table>
### Reference: Procedure Dimension Reports - 300 Series

<table>
<thead>
<tr>
<th>No.</th>
<th>Report Title and Contents</th>
<th>Interpreting Report Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>301</td>
<td><strong>Most Frequently Run Procedures</strong> lists the 30 most frequently executed procedures and their corresponding CPU usage sorted by frequency. You can re-sort by CPU to see the largest running procedures. Run FLRPT303 to list all procedures run during the period and review full usage details.</td>
<td>Frequently run procedures can generally be construed to be clearly valuable to the company. As such, you may want to get the most out of your investment by examining such procedures for efficiency, particularly if the CPU is high.</td>
</tr>
<tr>
<td>302</td>
<td><strong>FOCUS Command Usage</strong> presents a broad summary of FOCUS usage across your site. Typically, TABLE, that is, data extracts into reports or extract files will be the most used command. MODIFY indicates loads of, or transactions against, data files. Other major FOCUS functions are shown if they are used.</td>
<td>Re-sort by Duration, CPU or EXCP to identify the most used commands by category.</td>
</tr>
<tr>
<td>303</td>
<td><strong>Procedure Run Details</strong> lists every procedure run during the period showing the frequency, duration, CPU, and EXCP demands (and relative percent of each) within the period.</td>
<td>Re-sort by Duration, CPU, or EXCP to identify the most resource-intensive or widely-used procedures. Run FLRPT301 for a summary of the top 30 procedures.</td>
</tr>
</tbody>
</table>
Candidate Procedures for Pooled Tables Adaptation uncovers file usage patterns that appear to lend themselves to pooling, which could provide substantial CPU savings. This report has the potential of identifying procedures that can experience large CPU savings for relatively little investment.

Pooled Tables performs a single read of a data source for any number of consecutive reports against that source, delivering huge savings in I/O, and in CPU and elapsed times. Information Builders can help you evaluate the viability of pooling procedures listed on this report—contact your local Information Builders representative for details about Pooled Tables.

Reference: Usage Dimension Reports - 400 Series

<table>
<thead>
<tr>
<th>No.</th>
<th>Report name and contents</th>
<th>What to look for</th>
</tr>
</thead>
<tbody>
<tr>
<td>401</td>
<td>All LPARS Running FOCUS summarizes FOCUS usage/per period in each LPAR where FOCUS activity was recorded.</td>
<td>This is the only report of FOCUS activity by LPAR. You can re-sort the results by Duration or CPU.</td>
</tr>
<tr>
<td>402</td>
<td>Output Formats Used by Reports summarizes report destinations used during the period, revealing numbers of records extracted and lines output and the degree of aggregation (compression of application output). Many reports go directly to the user’s screen or are sent to FOCUS HOLD or SAVE files (the General category), and some are sent to other output formats available from FOCUS, listed below that. Only those formats used are listed. Resort by Records, Lines, or CPU to see the most common or intensive destination for FOCUS output.</td>
<td>High aggregation ratios show data is being aggregated into more readily interpretable information. A low ratio for SCREEN implies that the raw data is displayed potentially hundreds of screens deep, which is invariably impenetrable and should be re-evaluated for usability. Non-FOCUS output formats imply FOCUS is supplying data for third-party databases and analytical tools such as Excel or PDF.</td>
</tr>
</tbody>
</table>
### Daily User Activity Detail

**Report name and contents:**
Daily User Activity Detail shows daily activity for every online session for every user during the period.

**Caution:** This report could easily run hundreds or thousands of pages.

**What to look for:**
- This report provides the detail behind FLRPT102, Highest CPU-Consuming Users and Jobs.
- Look for repeated excessive expenses, which may in fact be perfectly valid high product usage.
- Re-sort by Records, Lines, Duration, or CPU to look for highest usage or minimal usage.

### Trend of Daily FOCUS Sessions (Report and Graph)

**Report name and contents:**
Trend of Daily FOCUS Sessions (Report and Graph) bar graph summarizes the number of batch sessions per day

**What to look for:**
- Review usage trends and analyze spikes.
- Days without sessions, including weekends, are not shown.

### Hourly CPU Usage Accumulated (Graph)

**Report name and contents:**
Hourly CPU Usage Accumulated (Graph) bar graph accumulates CPU usage for each hour of the day, rolling together all days in the period. That is, a bar represents all of the usage accumulated on all days in the period for that particular hour. Hours are sorted from midnight to midnight; hours with no activity do not display. An hour shown represents the minutes in that hour, so '2am' represents 2am-3am.

**What to look for:**
- Confirm the industry-typical trend of highest usage during workday hours and during peak times of overnight batch runs. Other spikes may be shift-related.
- Restrict the date range to one day to examine CPU usage on a particular day.
<table>
<thead>
<tr>
<th>No.</th>
<th>Report name and contents</th>
<th>What to look for</th>
</tr>
</thead>
<tbody>
<tr>
<td>406</td>
<td><strong>Possible Large Paper-Output Reports (100+ pages)</strong> details procedures generating large offline print files.</td>
<td>Confirm acceptable usage and number of runs. The largest printed reports are the ones to investigate.</td>
</tr>
<tr>
<td></td>
<td>The report sorts the list by the largest reports in terms of approximate number of pages generated (assuming 40 lines of output per page, allowing for some typical lines of heading, footing, column heading, subfootings, blank lines, etc.). The report shows the procedure that ran the report and the (main) file against which the extract was done, as well as the number of times the report was so generated.</td>
<td></td>
</tr>
<tr>
<td>407</td>
<td><strong>Daily Batch/Online CPU Utilization by Shift</strong> categorizes CPU utilization by operating mode (online versus batch sessions) by approximate shifts (from 8AM to 6PM and from 6PM to 8AM) for each day in the report period.</td>
<td>A useful report for confirming performance is within normal bounds and if your CPU usage is inline with industry trends.</td>
</tr>
<tr>
<td>408</td>
<td><strong>Long-Running Sessions</strong> is an elapsed-time summary that rolls up all batch jobs and online sessions during the period, displaying the longest and average durations and number of runs within two ranges of hours (&gt;2 and &gt;7).</td>
<td>Average numbers from this report should be useful in evaluating the data on other reports.</td>
</tr>

   MODIFY 162
   TABLE COMPUTE 162
DBA passwords 180, 347
DBACSENSITIV parameter 256
DDECPX field 373
DDNAME field 373
DDNAMEs for FOCREPLAY 231
default log file 358 to 359
DEFEOCHO parameter 176
DEFINE
  compiling 106
DETAIL, specifying detailed log file 359
detailed log file 359
DEVFLAG field 373
DHTML output format 155
diagram of FOCLOG Master File 374
Dialogue Manager 182, 344
  &FOCFEXNAME variable 252
    increased number of amper variables 344
    quote-delimited strings 182 to 183
    setting numeric precision 170
    unlimited amper variable name length 344
    variables in Master File DEFINEs 294
DIRECTHOLD parameter 19
DMPRECISION parameter 170
DROP option for CREATE FILE 297
DSNAME field 373
DSNORD field 373
DSNS RECTYPE 373
DSNTEMP field 373

E
EMPTYREPORT parameter 64 to 65
error handling for FOCREPLAY 251
ERROROUT parameter 221
  override option 222 to 223
escape characters for like and unlike 24
estimating log file size 357
example 363, 367
  FOCLOG validation 363, 367
Excel 2000 TOCs (tables of contents) 138 to 139
excel locking 157
Excel Named Ranges 129 to 130
  Compound Excel reports 130
  support for 131
Excel reports 138 to 139
Excel workbook 129 to 130
EXL2K TOCs (tables of contents) 138 to 139
expressions, compiling in MODIFY 19
extended currency symbols 272
  formats 272
extract files 117
  SAME_DB 331 to 332, 334 to 335
  temporary tables 331 to 332, 334 to 335
EXTSORT field 372

F
FETCHJOIN command for Adabas 324
field reformattting and missing values 253
